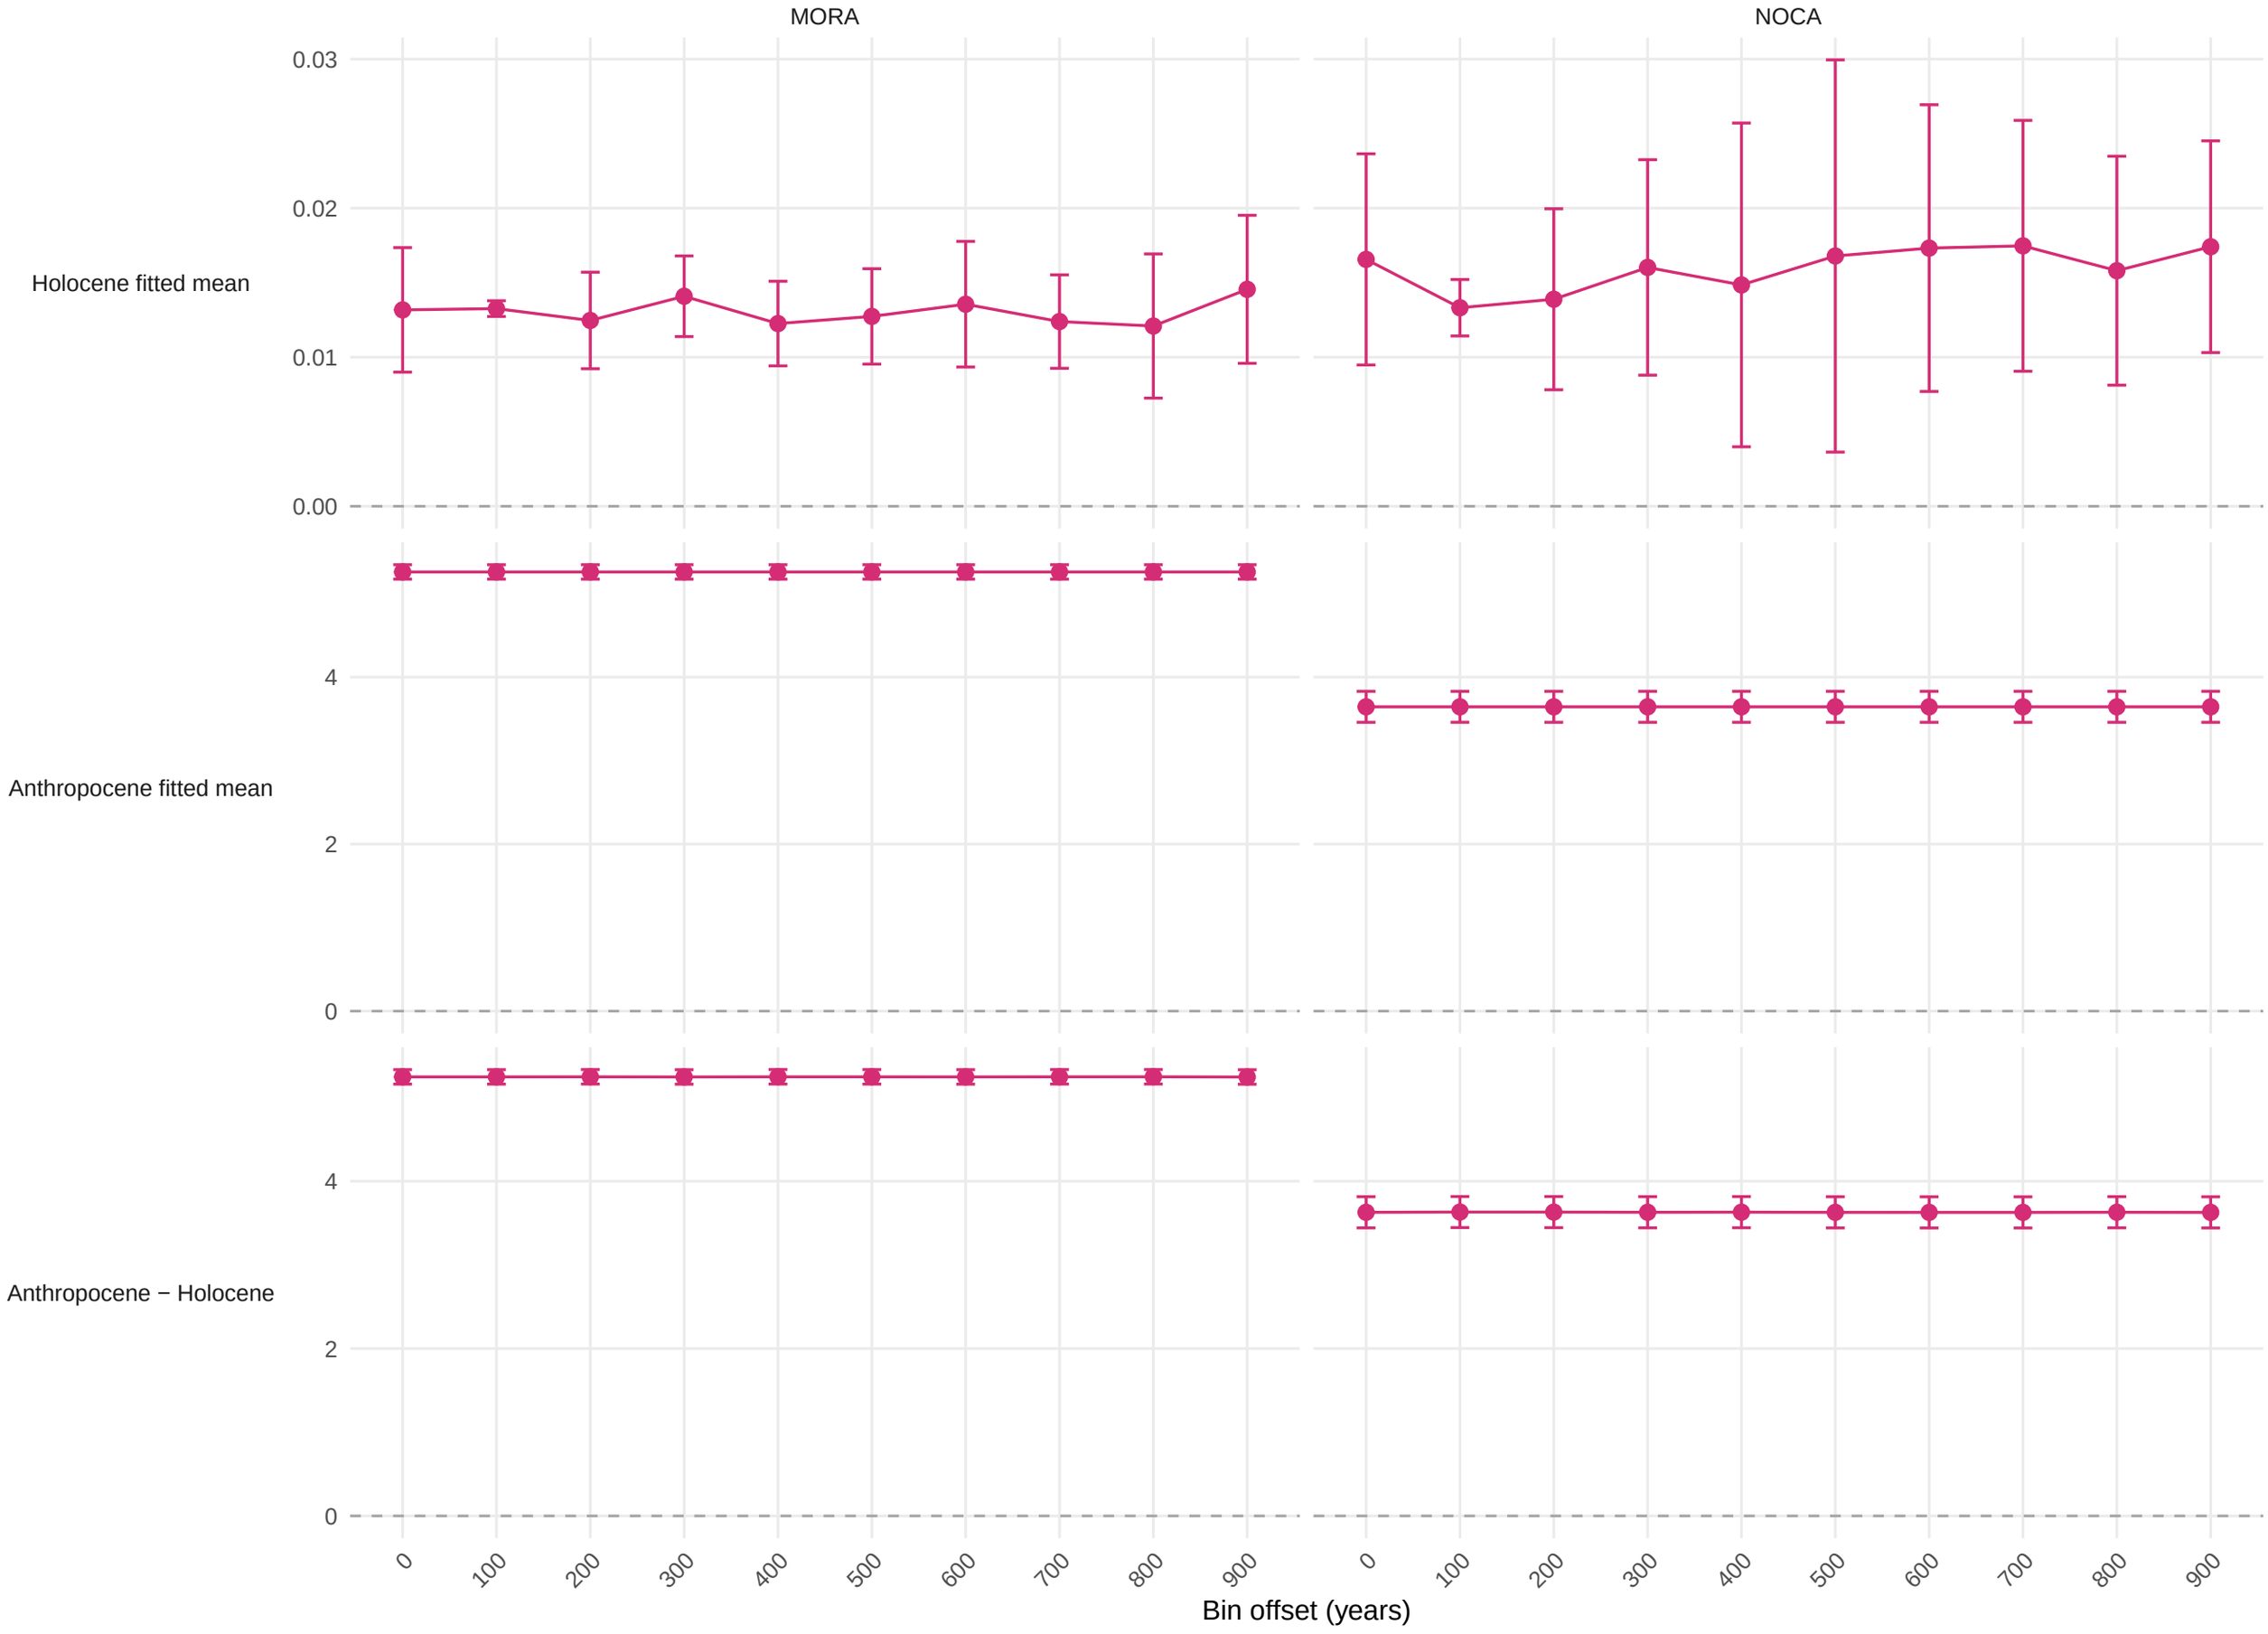
MA(1) fitted group means and contrasts: Physical climate−change rate

10 separate offset models; REML, era × site and era/site residual variances



Points: model−based group means or Anthropocene−minus−Holocene contrasts. Bars: unadjusted 95% Satterthwaite intervals.
Rows have separate y−scales; parks share the same scale within each row. Contrasts use the fitted covariance of the means.
Offsets reuse modern plots and are sensitivity fits, not independent replicates. Chronology uncertainty is not propagated.
