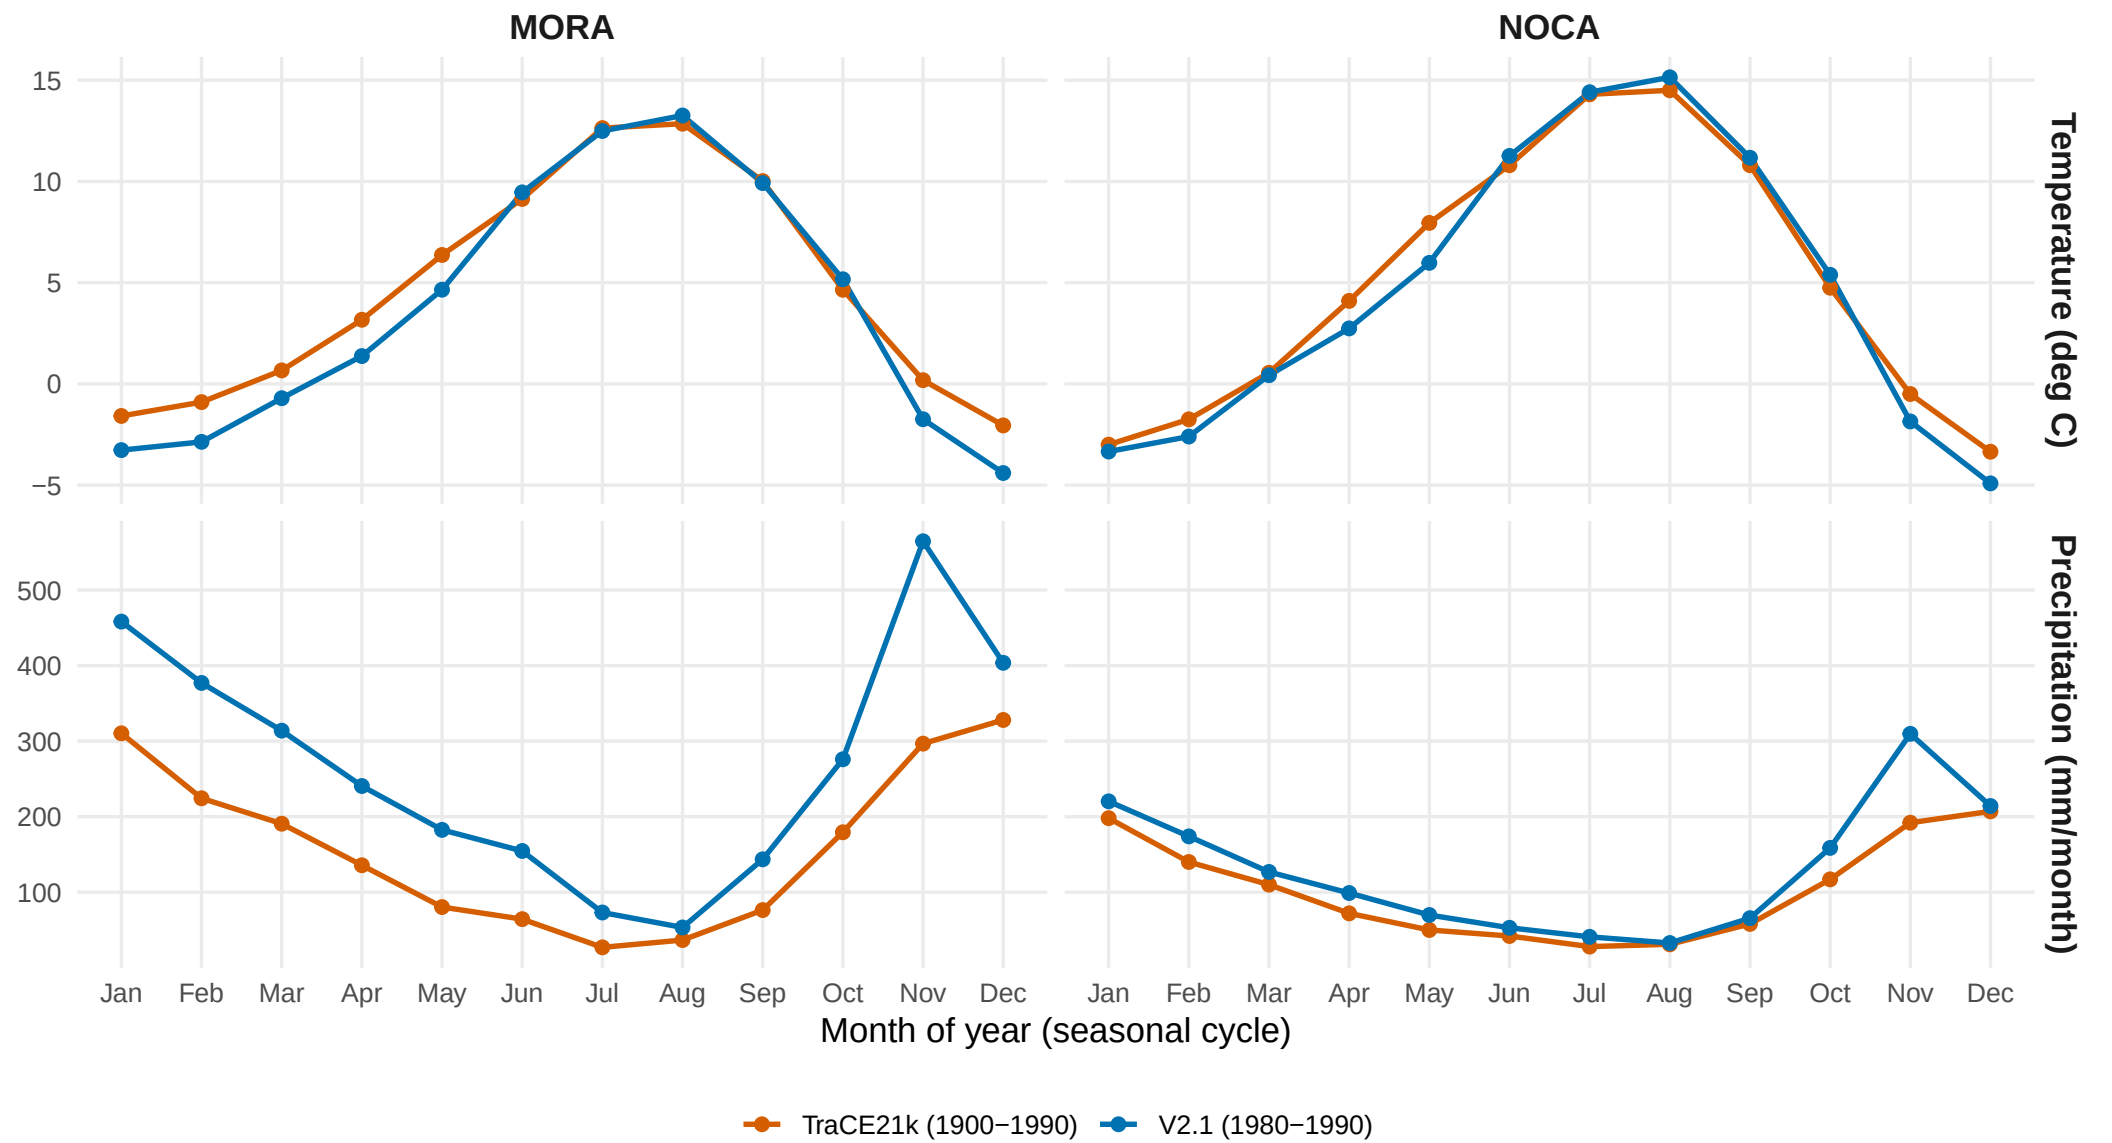
TraCE21k versus V2.1: monthly climate comparison

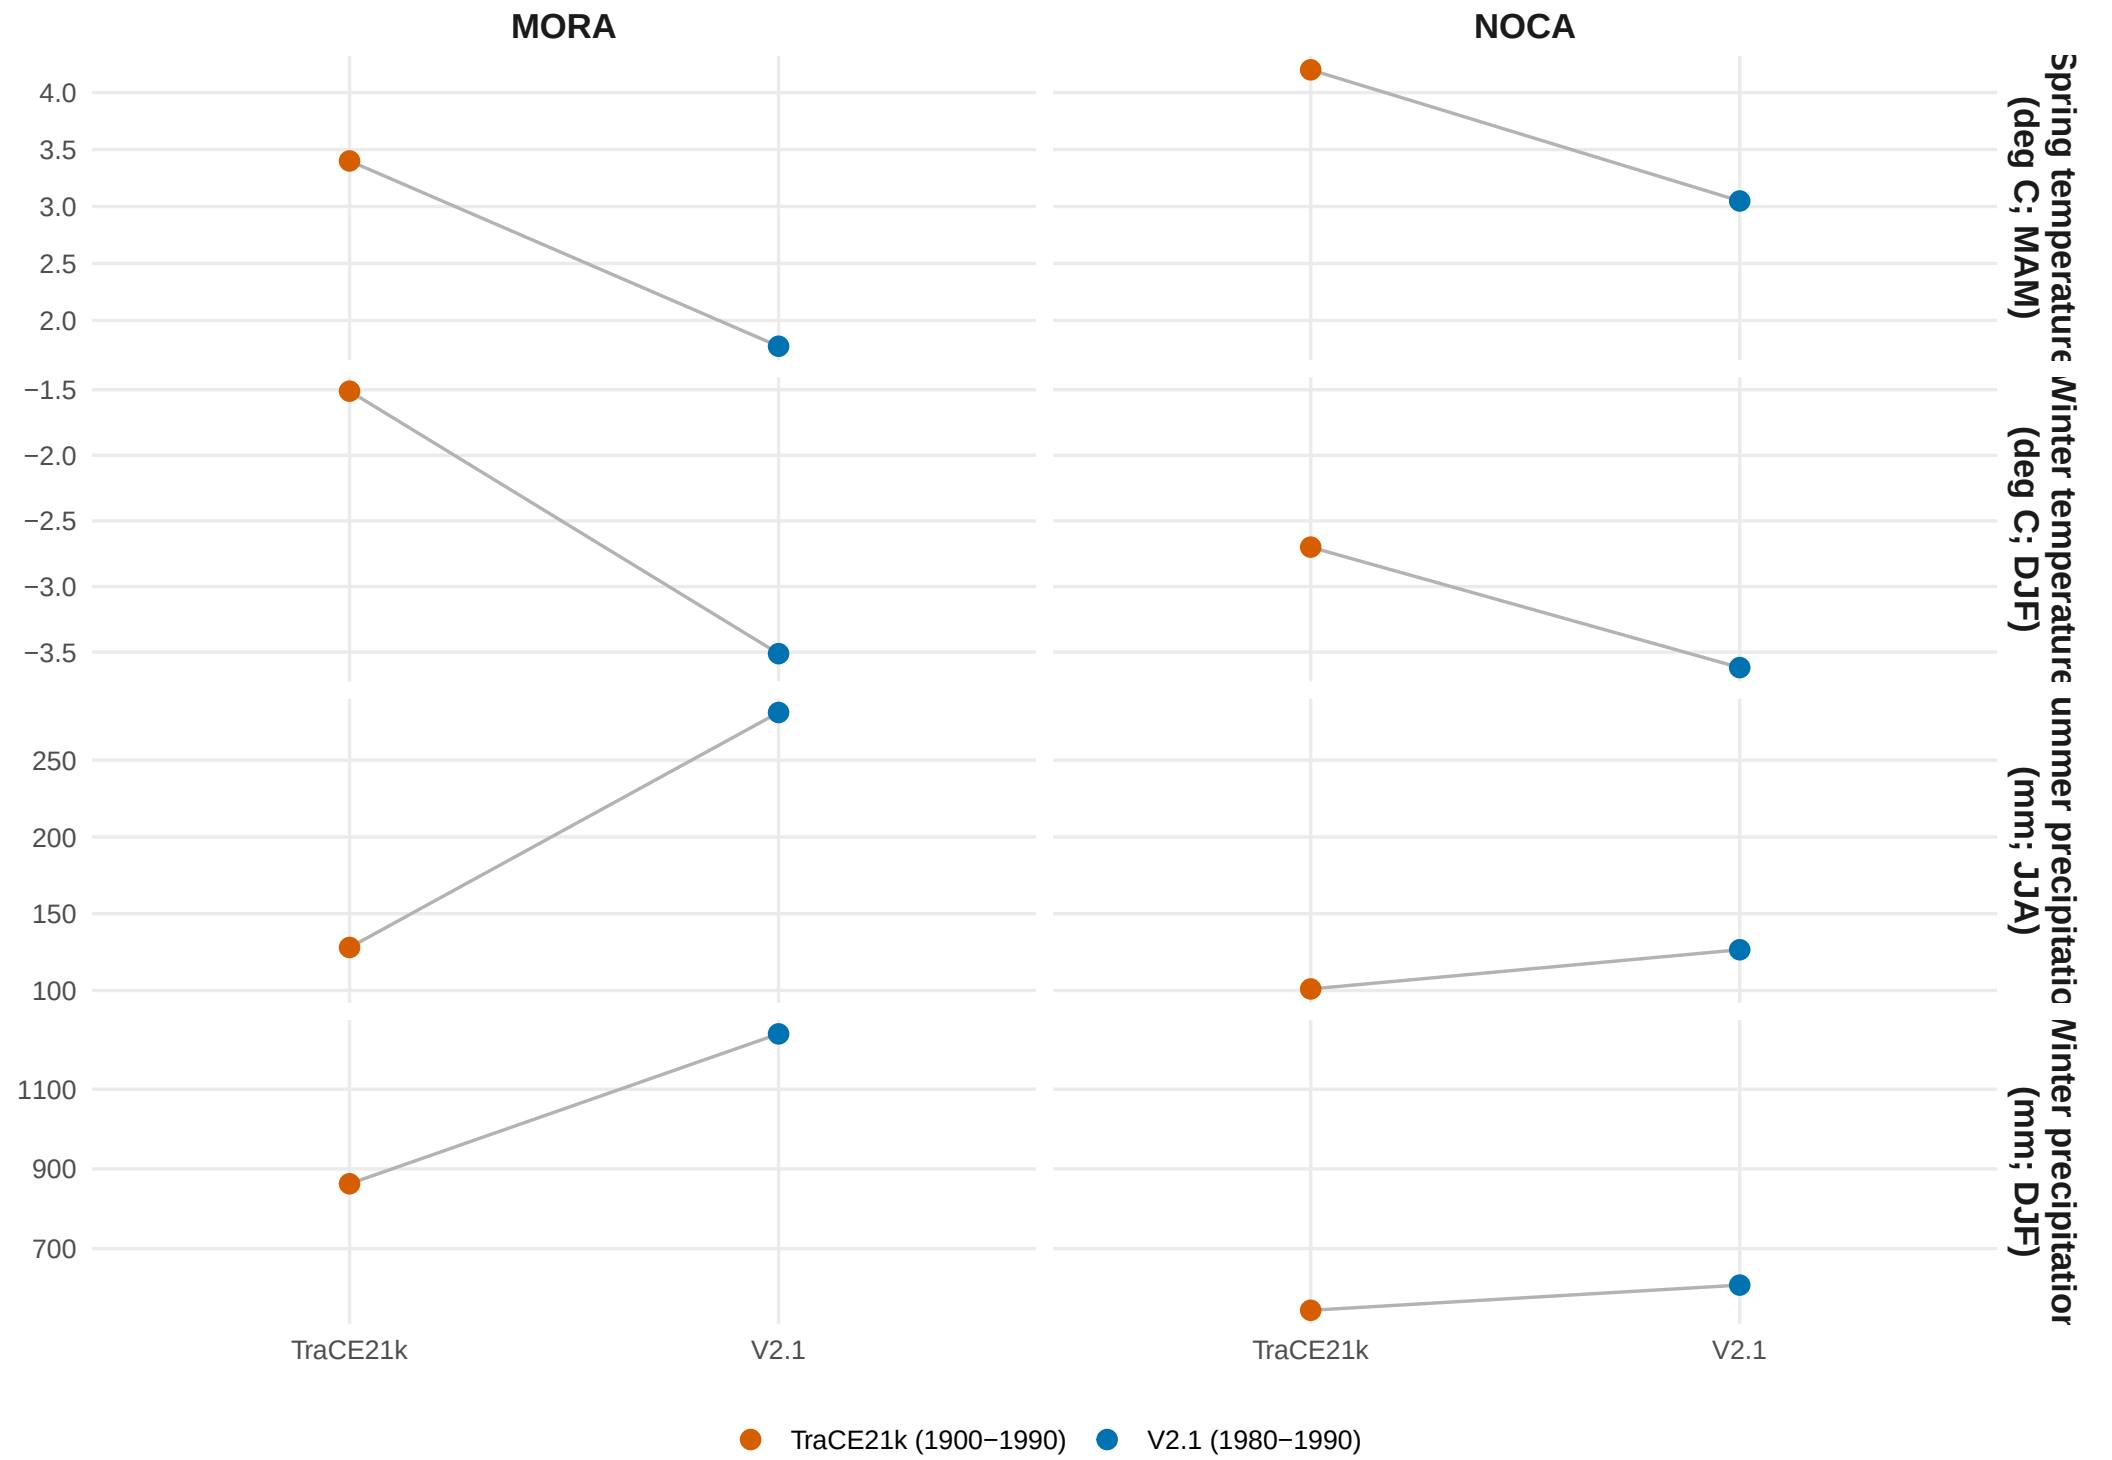
Final TraCE slice: 1900−1990 climatology. V2.1: averages of the corresponding months in 1980−1990.



Same current locations: MORA = equal mean of three ponds; NOCA = Panther Potholes. Temperature = (tasmin + tasmax)/2.
Different averaging periods: this comparison describes climate levels and seasonality, not agreement in annual changes or an isolated model bias.

The four analysis variables: product−level comparison

Same pond locations and seasonal definitions; TraCE 1900−1990 versus V2.1 1980−1990.



Same current locations: MORA = equal mean of three ponds; NOCA = Panther Potholes. Temperature = (tasmin + tasmax)/2.
Different averaging periods: this comparison describes climate levels and seasonality, not agreement in annual changes or an isolated model bias.
DJF uses the three monthly climatology means. These are descriptive summaries; current analysis outputs are unchanged.
