Climate change, community turnover and lag change

Offset 0 · Raw input distributions and MA(1) GLS estimates

Violins and dots: untransformed model inputs. Open circles and connecting lines: fitted era means; bars: 95% confidence intervals.
A − H: Anthropocene minus Holocene, with its covariance−based 95% interval. All model intervals use Satterthwaite degrees of freedom.
Holocene inputs are chronology−draw medians for actual lake transitions; Anthropocene inputs are individual paired plots.
