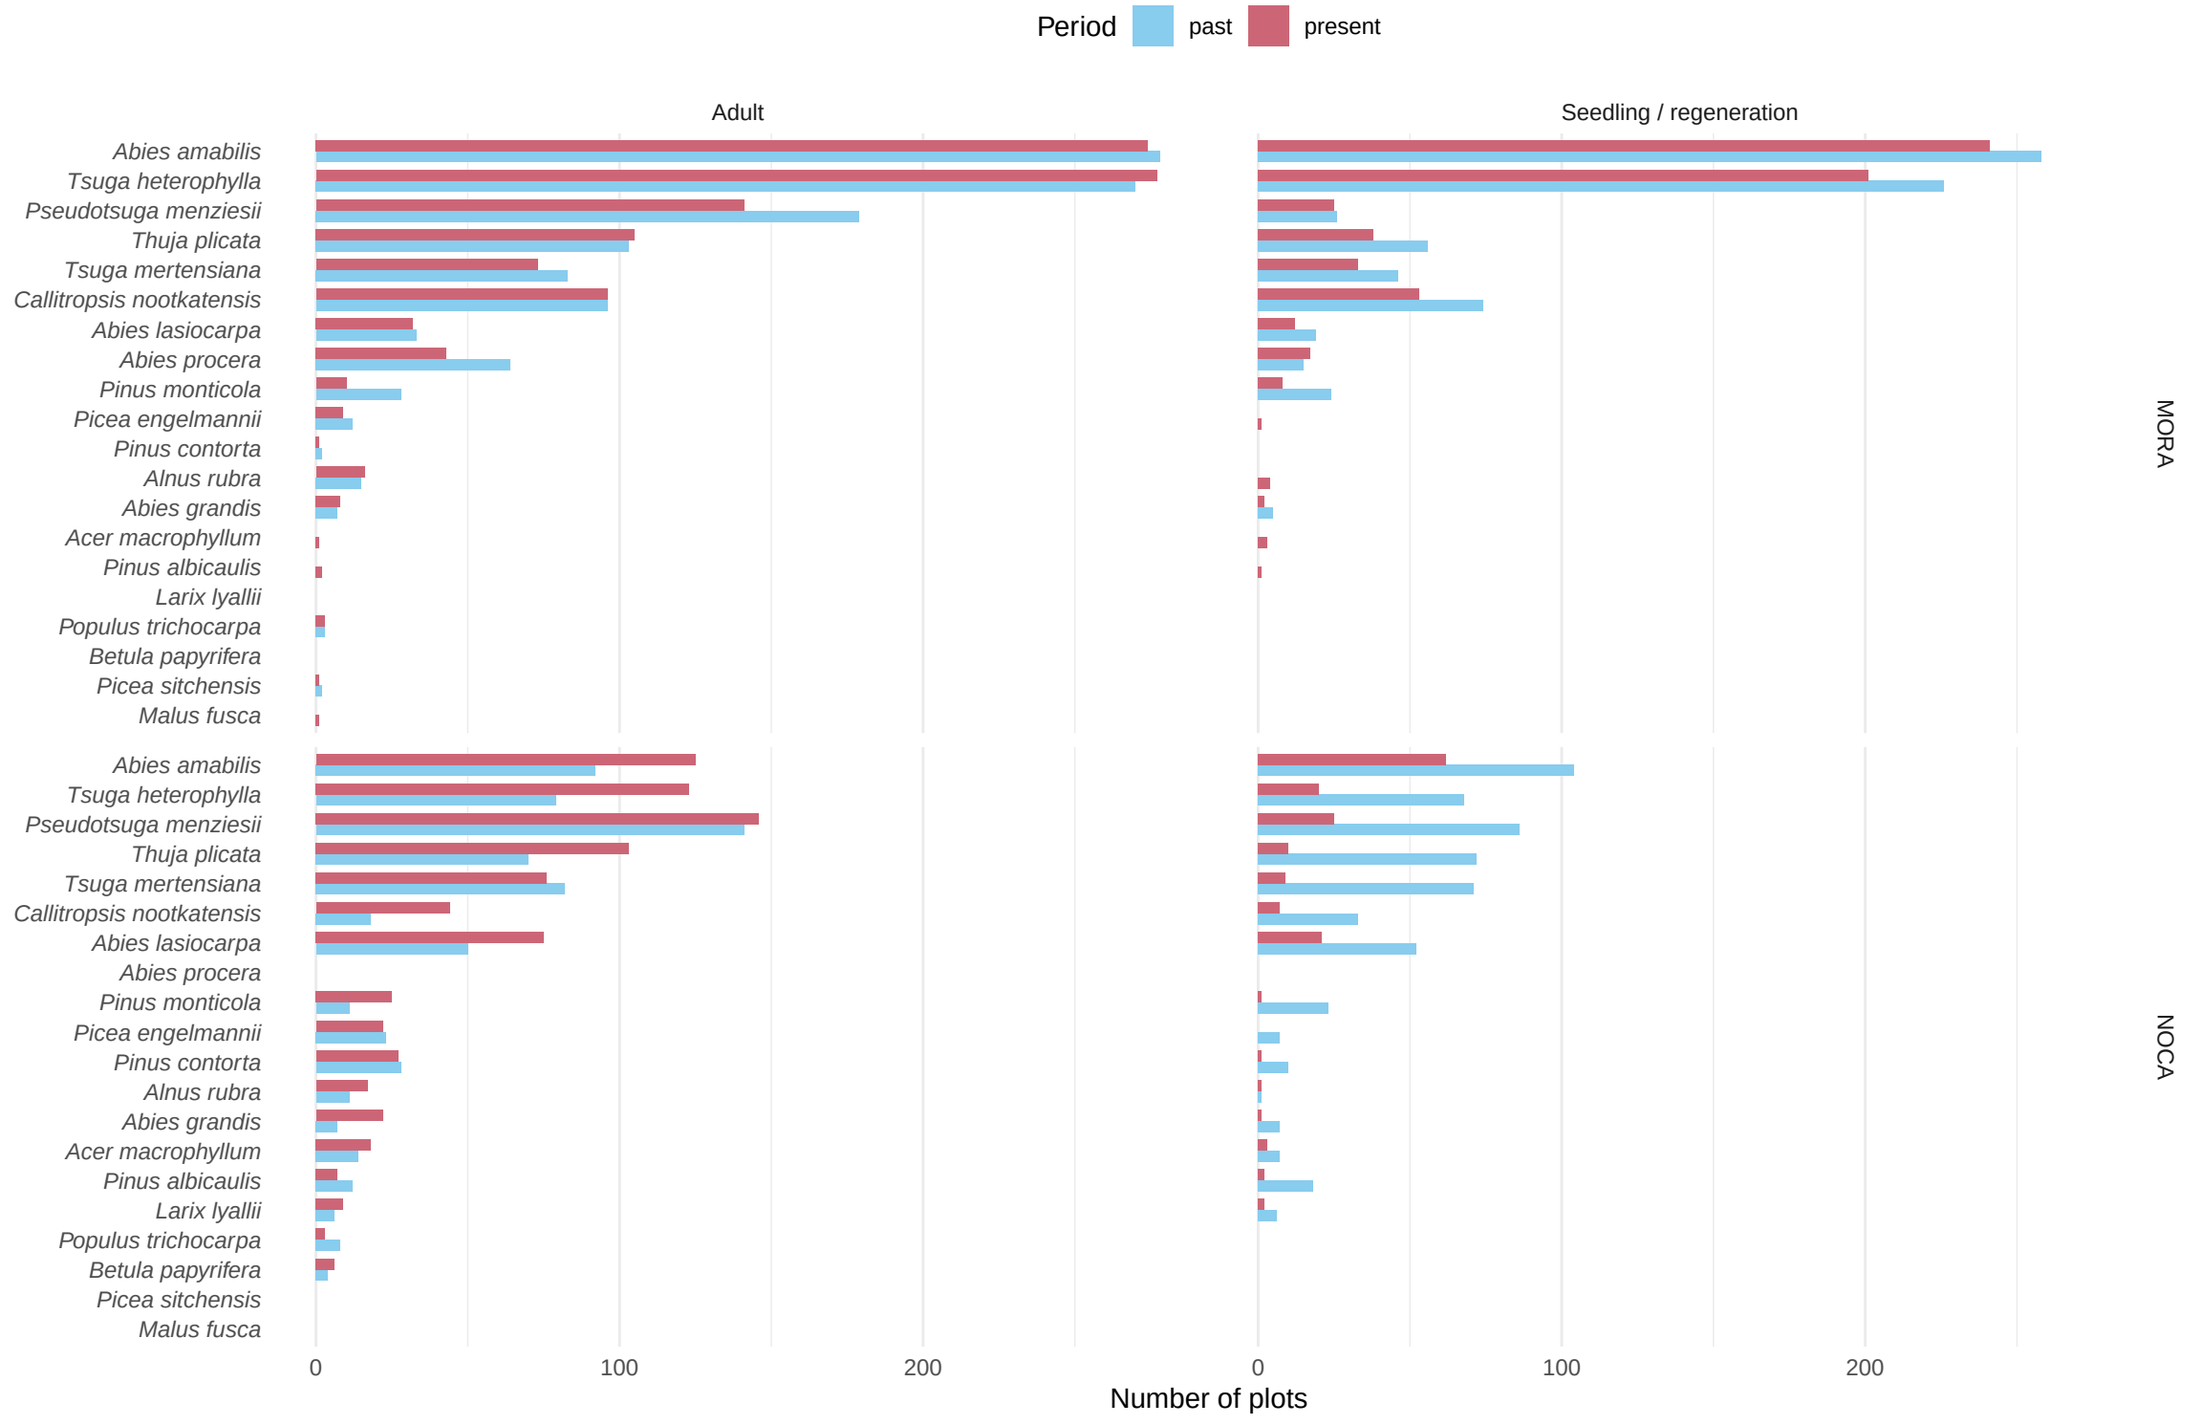
Adults vs regeneration, past vs present

Plots per species, past and present side by side within each stage − localises a change to adults or to regeneration. Consolidated species set (understory taxa removed).



Adults are comparable across all four panels. REGENERATION IS NOT: NOCA past uses the legacy 0−3 m height class, whereas MORA (both eras) and NOCA present use 10−140 cm seedling surveys. The NOCA past−vs−present regeneration contrast is therefore confounded by band width.
