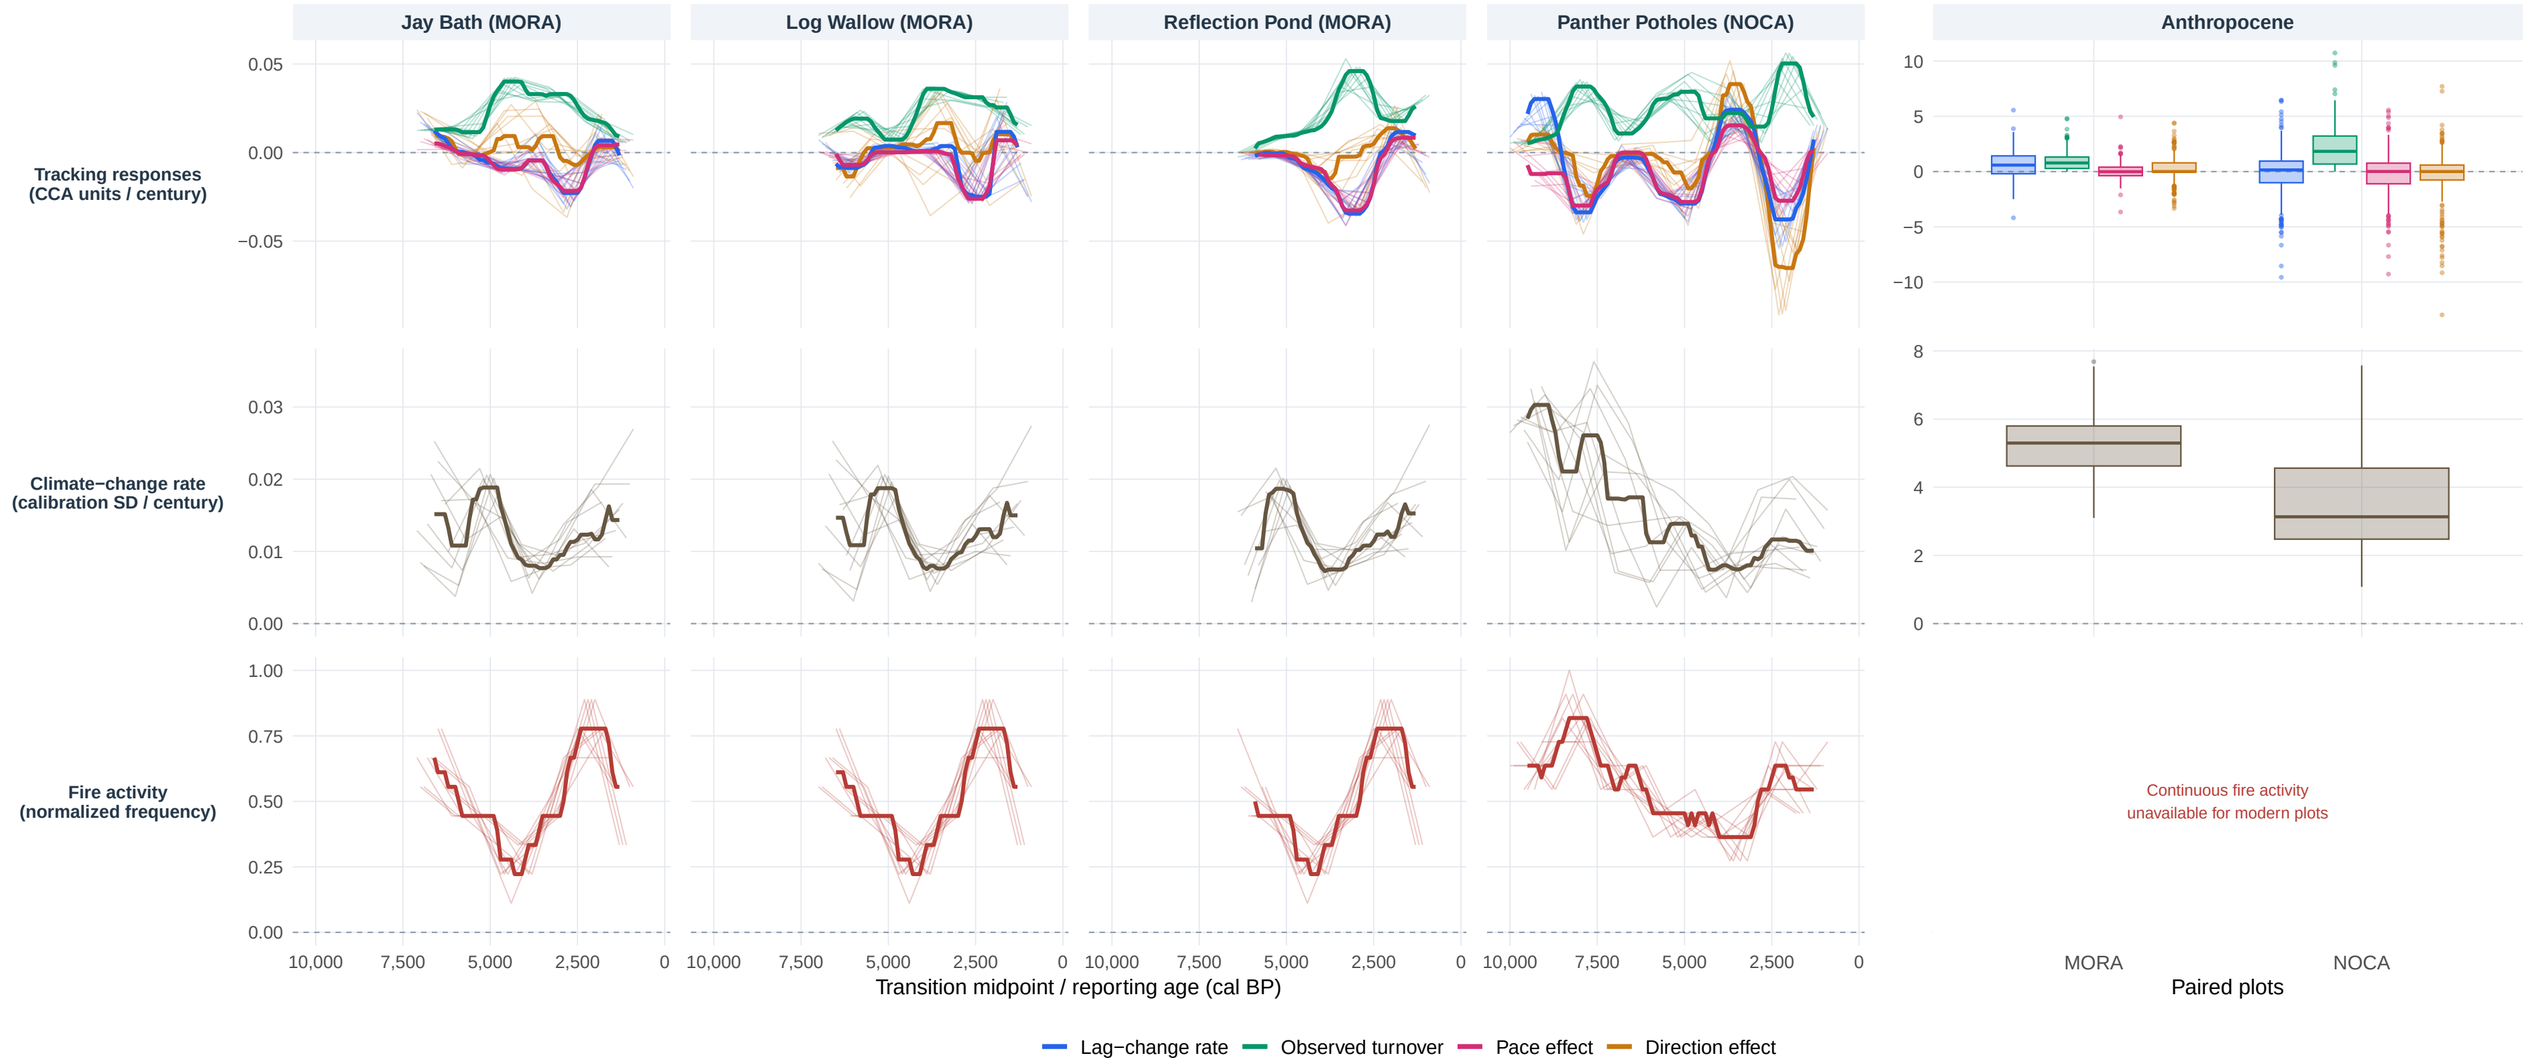
Tracking responses, climate and fire

Four Holocene lake columns with aligned cal−BP axes; Anthropocene paired−plot boxplots



Thin: individual offsets. Thick: medians across all 10 offsets with complete finite support. Response medians reuse the maintained reporting grid.
The four Holocene columns share scales by row; the Anthropocene column uses its own labeled y−scales. Boxes show finite values from 330 MORA / 277 NOCA paired plots.
Climate is the standardized physical climate−change rate. MORA lakes share regional fire exposure; modern fire is binary burned, not continuous charcoal activity.
