Correlation between climate variables, Holocene vs Anthropocene

The CCA learns the species−climate relationship from the ANTHROPOCENE plots and applies it to HOLOCENE samples.
Contrasting covariance structures can limit transfer; correlations alone do not test predictive validity.

Sign flips with |r| > 0.2 in both eras: MWT~MST (−0.58 vs 0.85); MST~MWT (−0.58 vs 0.85); AP~MWT (0.47 vs −0.21); SP~MWT (0.41 vs −0.28); WP~MWT (0.54 vs −0.21); MWT~AP (0.47 vs −0.21); MWT~SP (0.41 vs −0.28); MWT~WP (0.54 vs −0.21)
