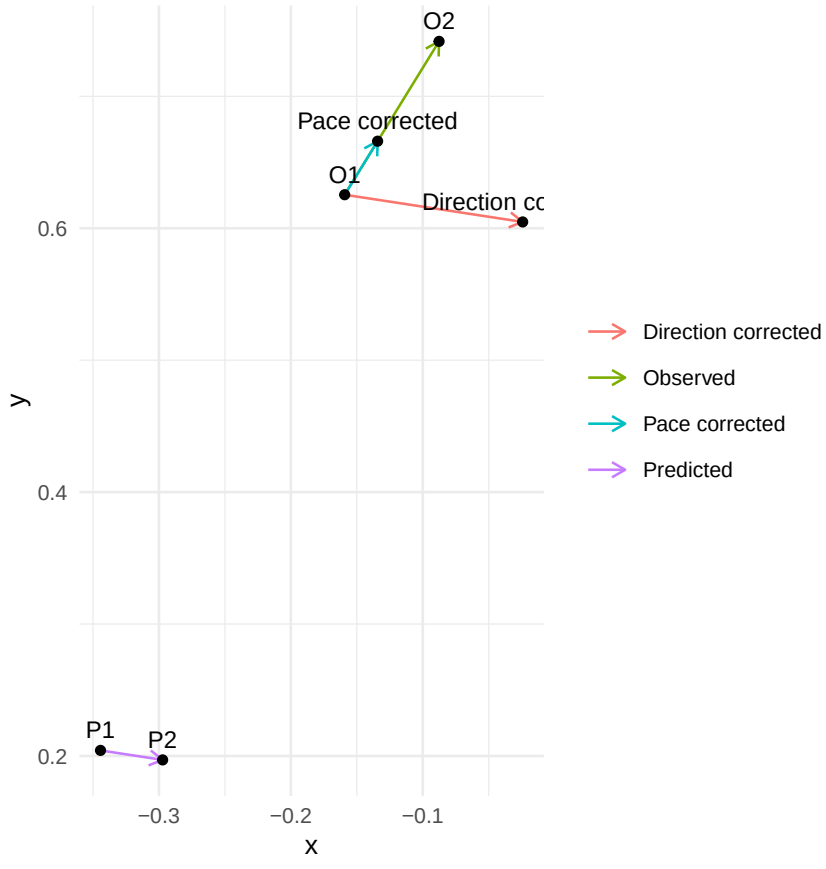
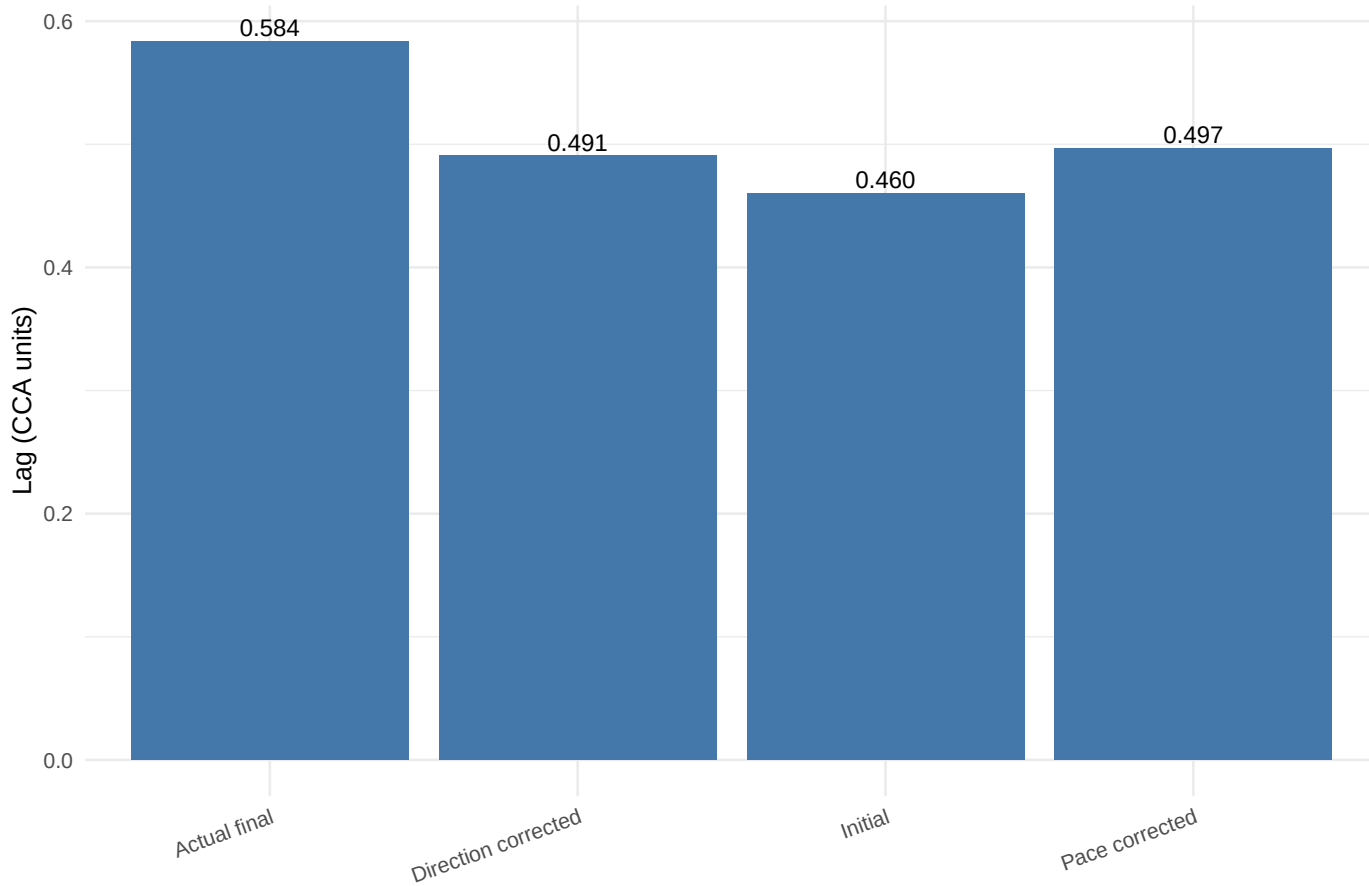
Panther Potholes: 3500 to 2500 cal BP

Offset 0; geometry draw 1; 100 of 100 draws support this actual transition.

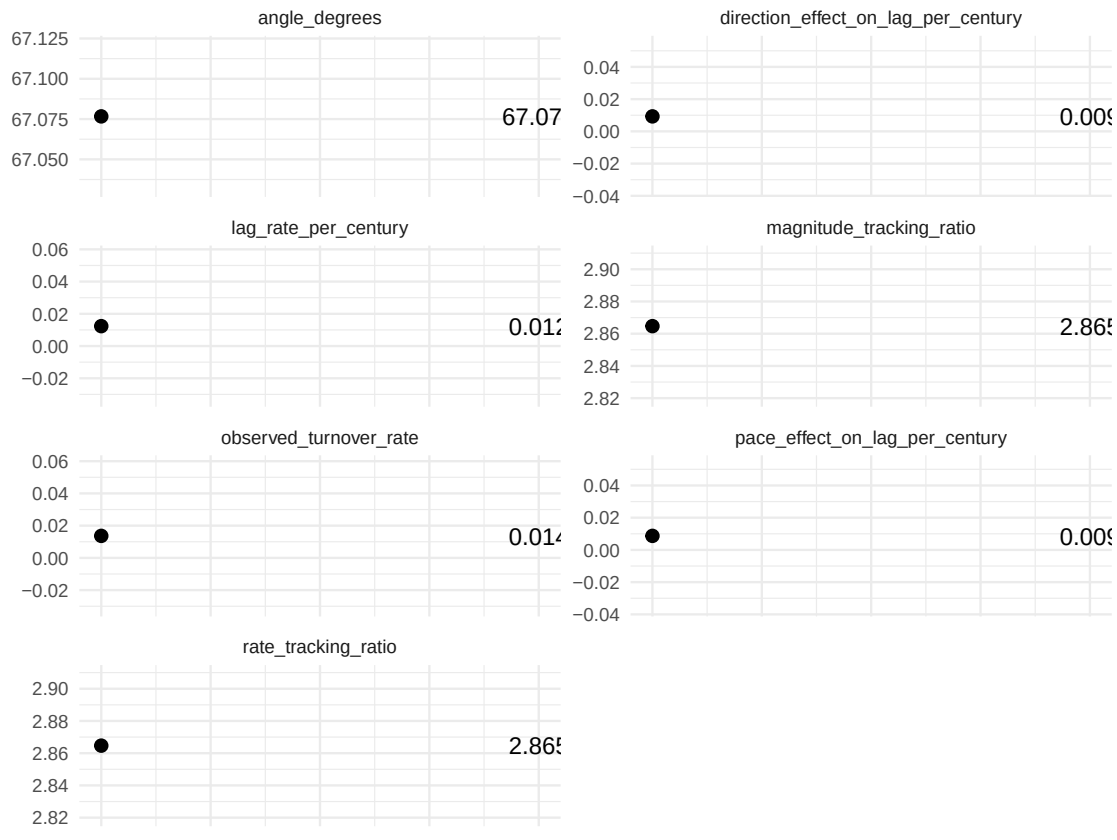
A. Actual and corrected movement



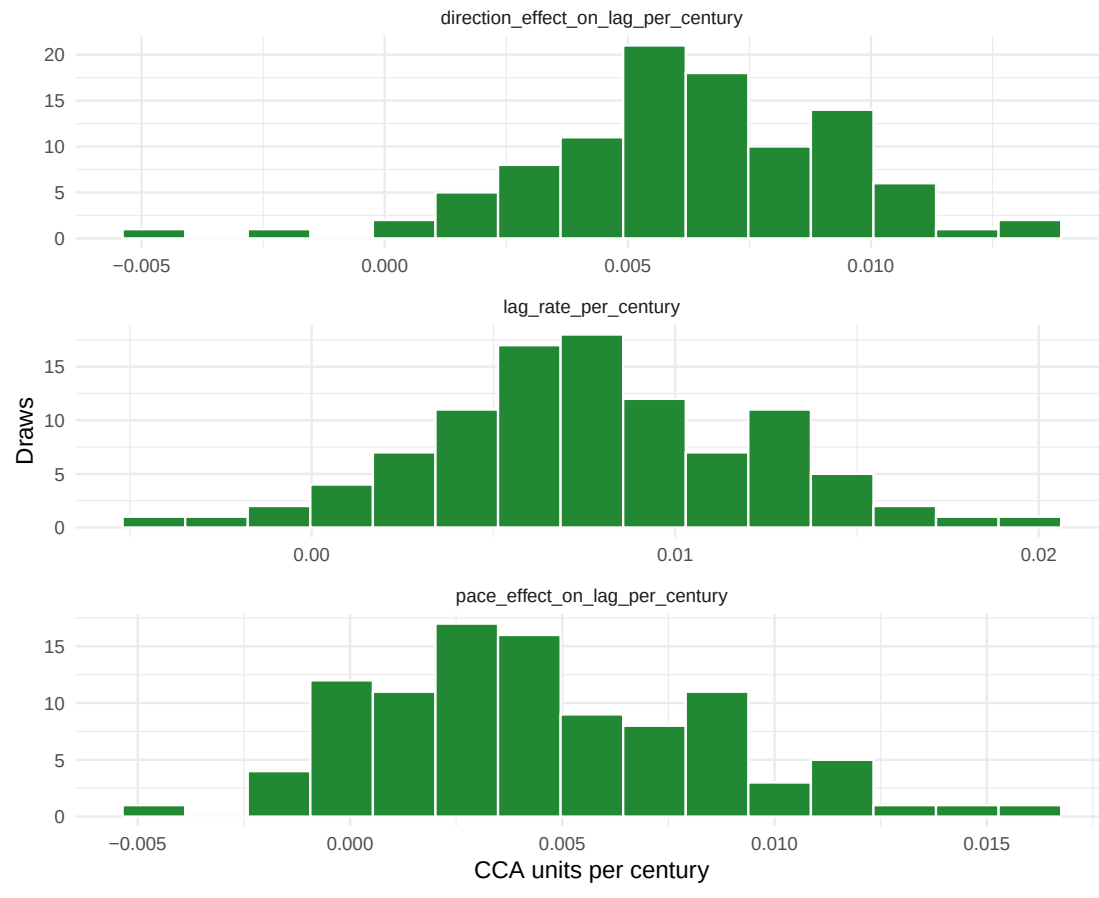
B. Distance to actual predicted position



C. Focused quantities for this draw



D. Valid chronology−draw distributions



Both corrections start at O1. Effects compare with the actual final lag and are nonadditive. Climate bins contain ten native slices. Chronology distributions are conditional on valid realizations; draws and offsets are not ecological replicates.
