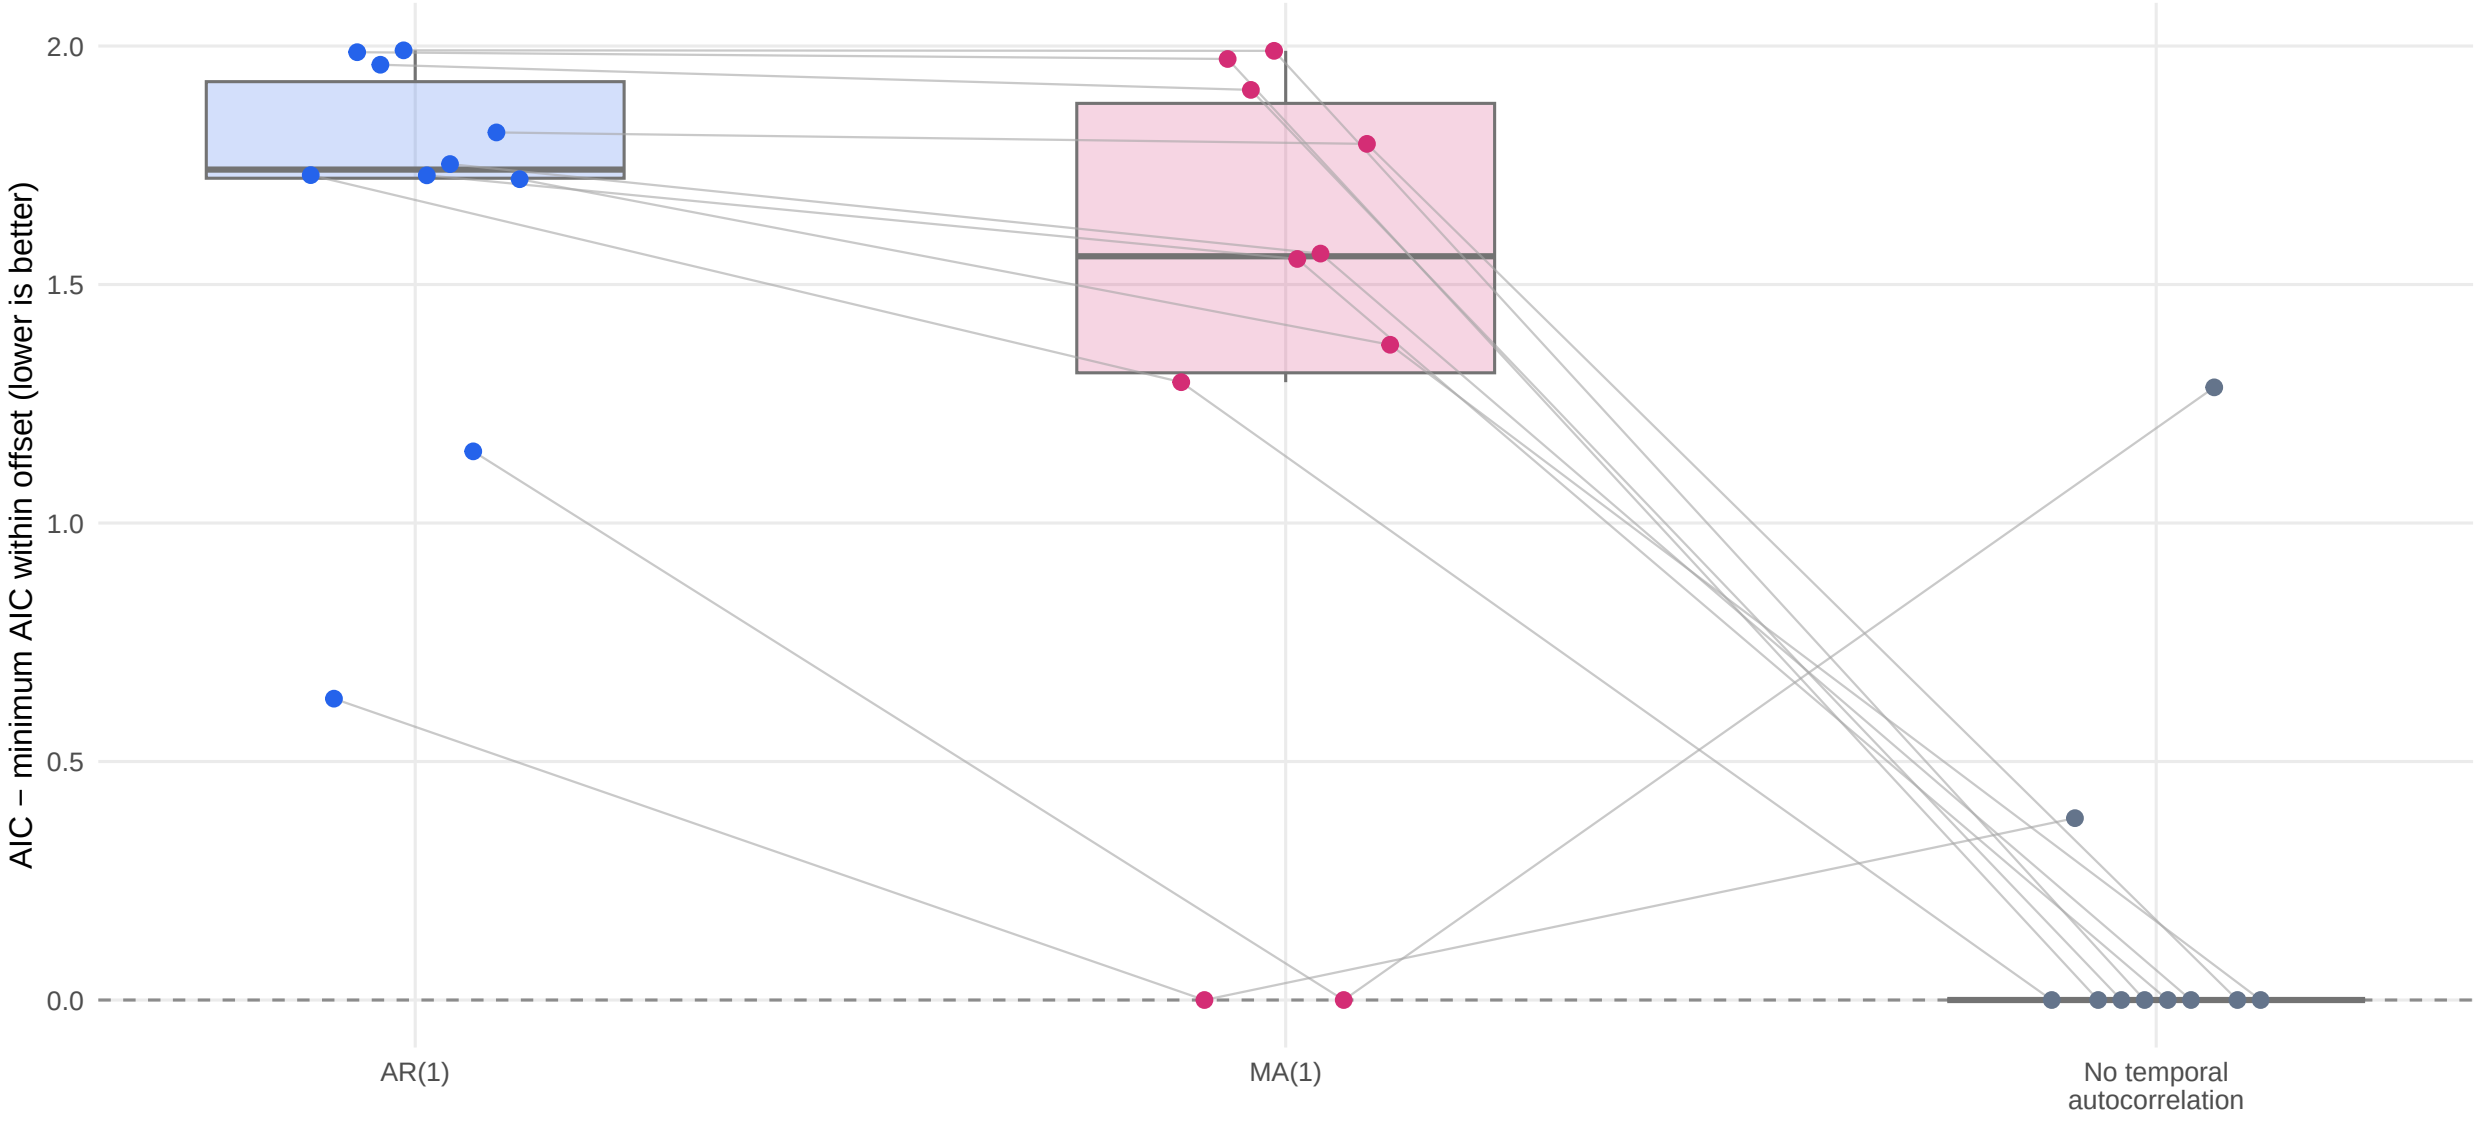
Within−offset covariance comparison: Direction−corrected lag−change rate

10 offsets; same observations, fixed effects, REML and era/site residual variances within each offset



Zero identifies the lowest AIC within each offset. Boxes summarize offsets; dots are fits; grey lines connect the same offset.
Offsets reuse modern plots and are sensitivity fits, not independent replicates. Raw AIC values remain in model_comparison.csv.
MA(1) is the requested reporting structure. Assess covariance support separately for each response using this comparison.
