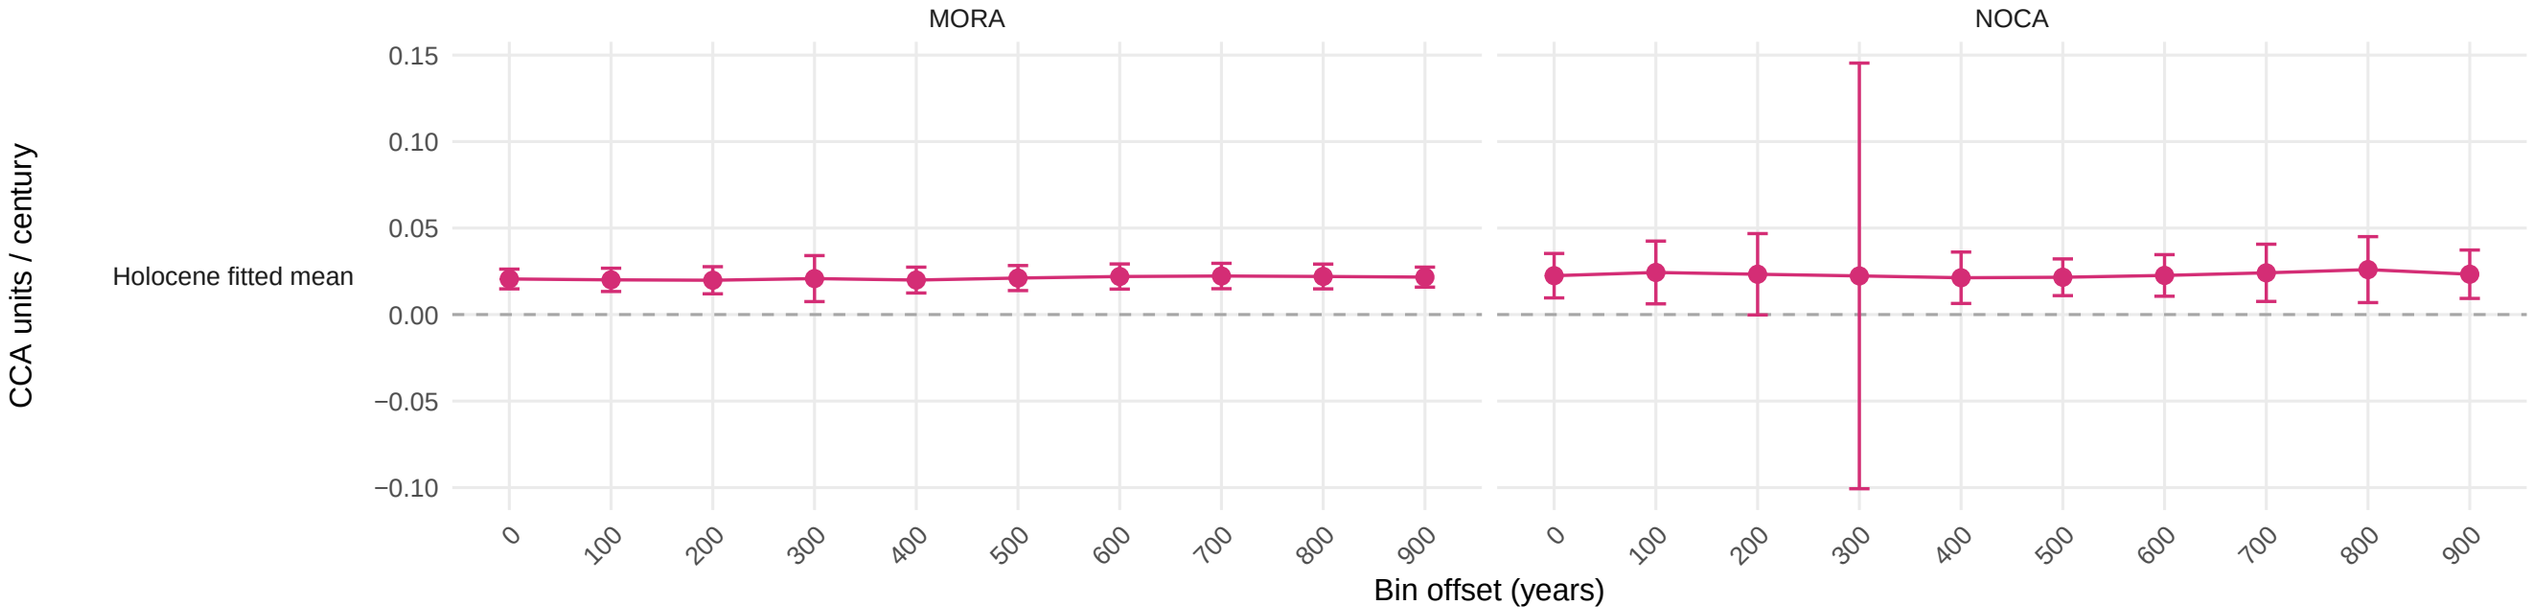
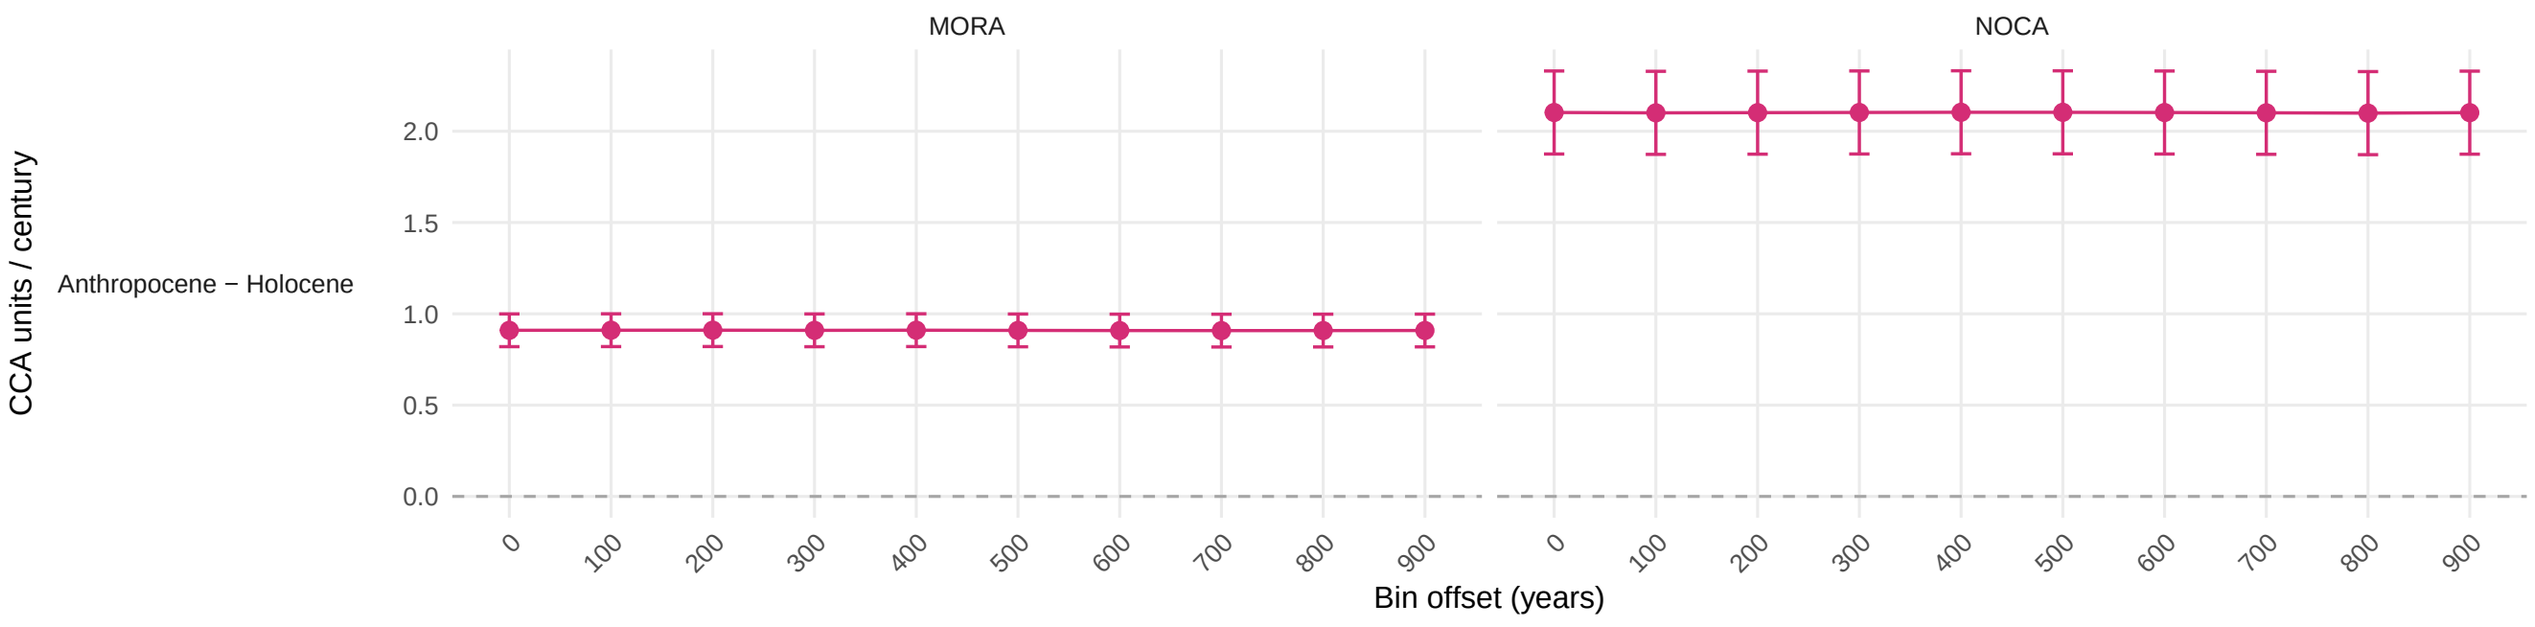
MA(1) fitted group means and contrasts: Observed community turnover

10 separate offset models; REML, era × site and era/site residual variances





Anthropocene means appear once per park; their 95% intervals are from the offset 0 fit.
Holocene means and contrasts retain all offsets. Bars: unadjusted 95% Satterthwaite intervals.
Rows have separate y−scales; parks share scales within each row. Contrasts use each fit's covariance of the means.
Offsets reuse modern plots and are sensitivity fits, not independent replicates. Chronology uncertainty is not propagated.
