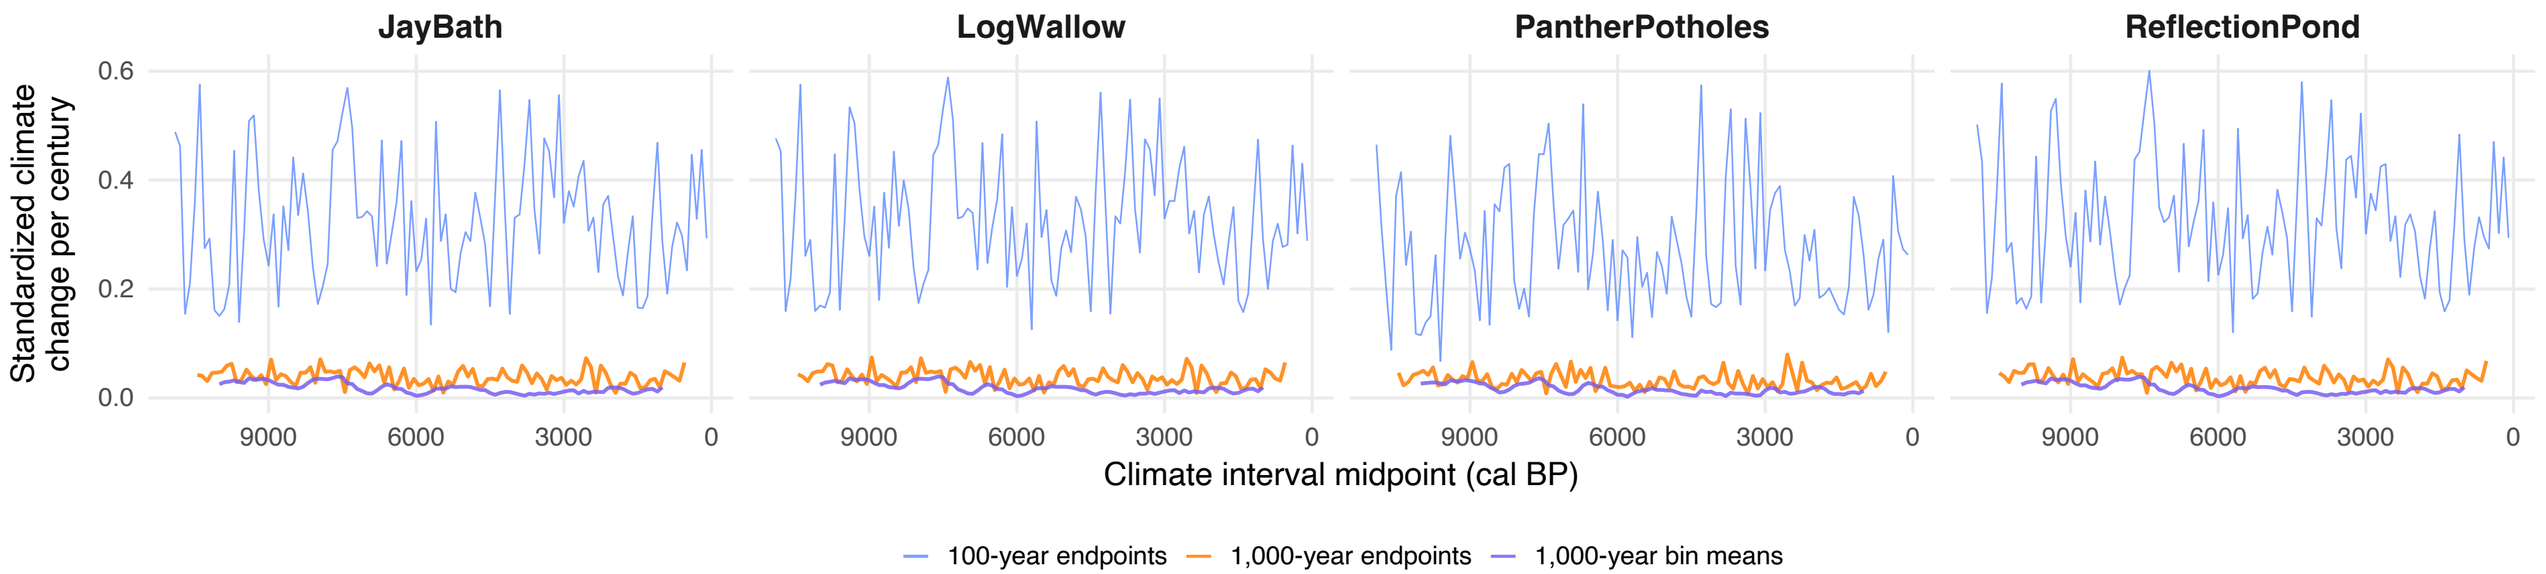
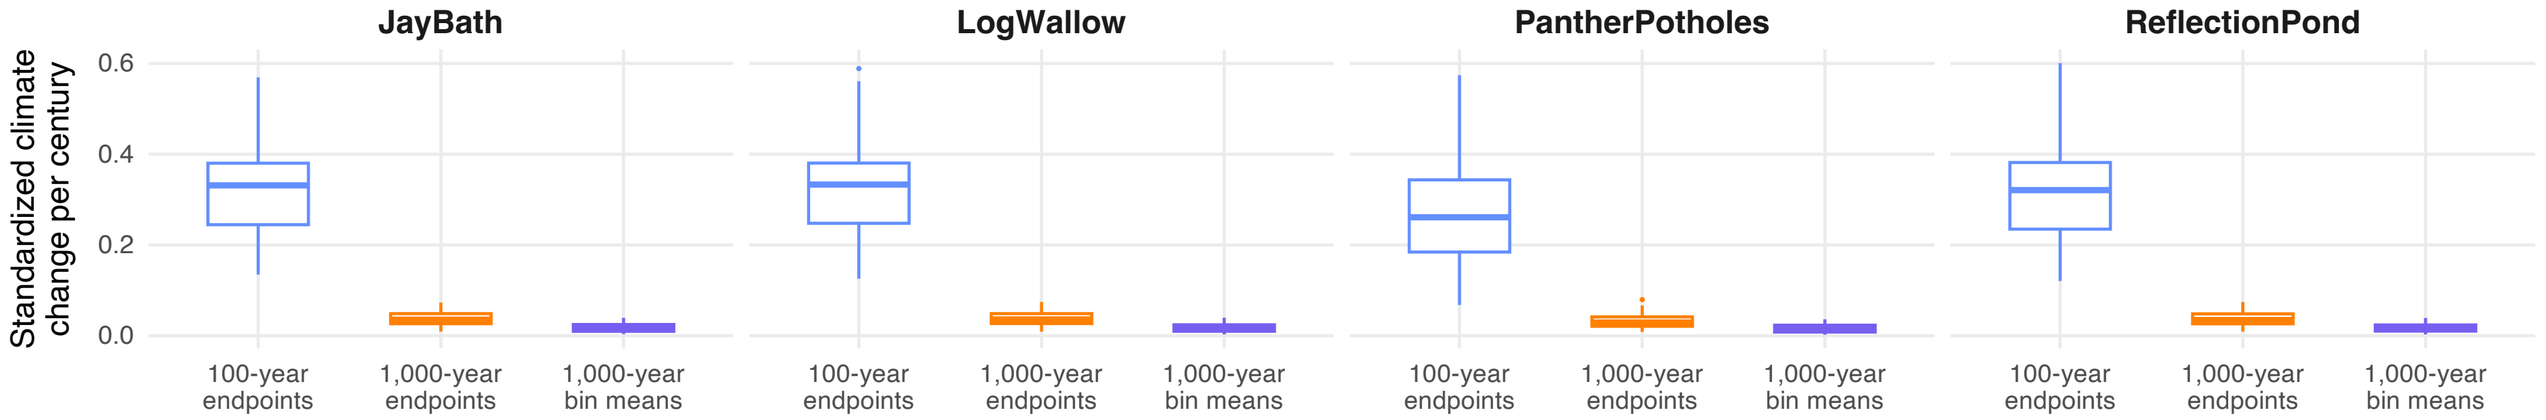
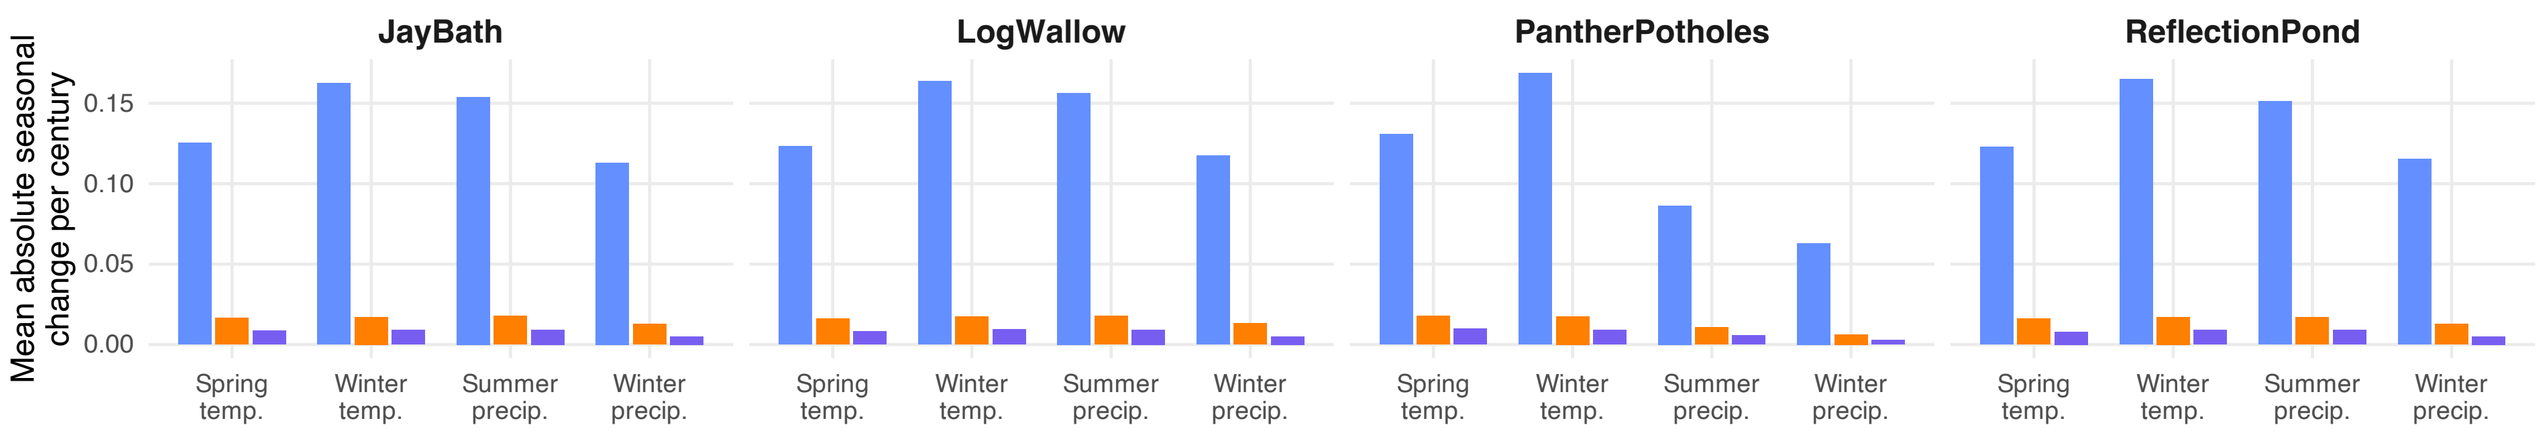
Same CHELSA series and calibration SDs; different temporal scales



Rate distributions over the common midpoint range: 1000–10000 cal BP



Seasonal components, using the same standardization



All rates use the same four seasonal variables and pooled calibration SDs; units are standardized climate distance per century.
Overlapping intervals are descriptive calculations, not independent replicates. Boxes summarize rates, not uncertainty.
The 1,000-year bin-mean series reproduces the previous climate calculation; accepted CC/S classifications remain unchanged.
