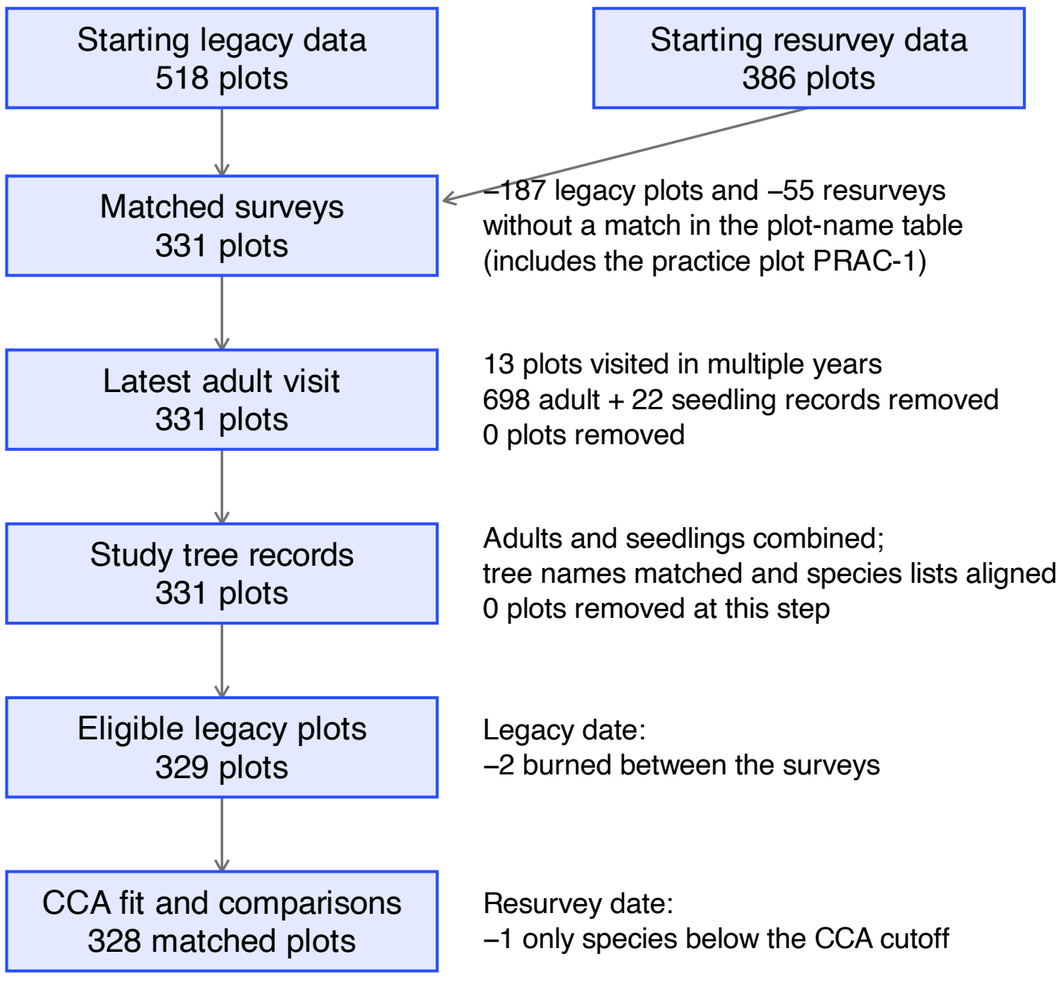
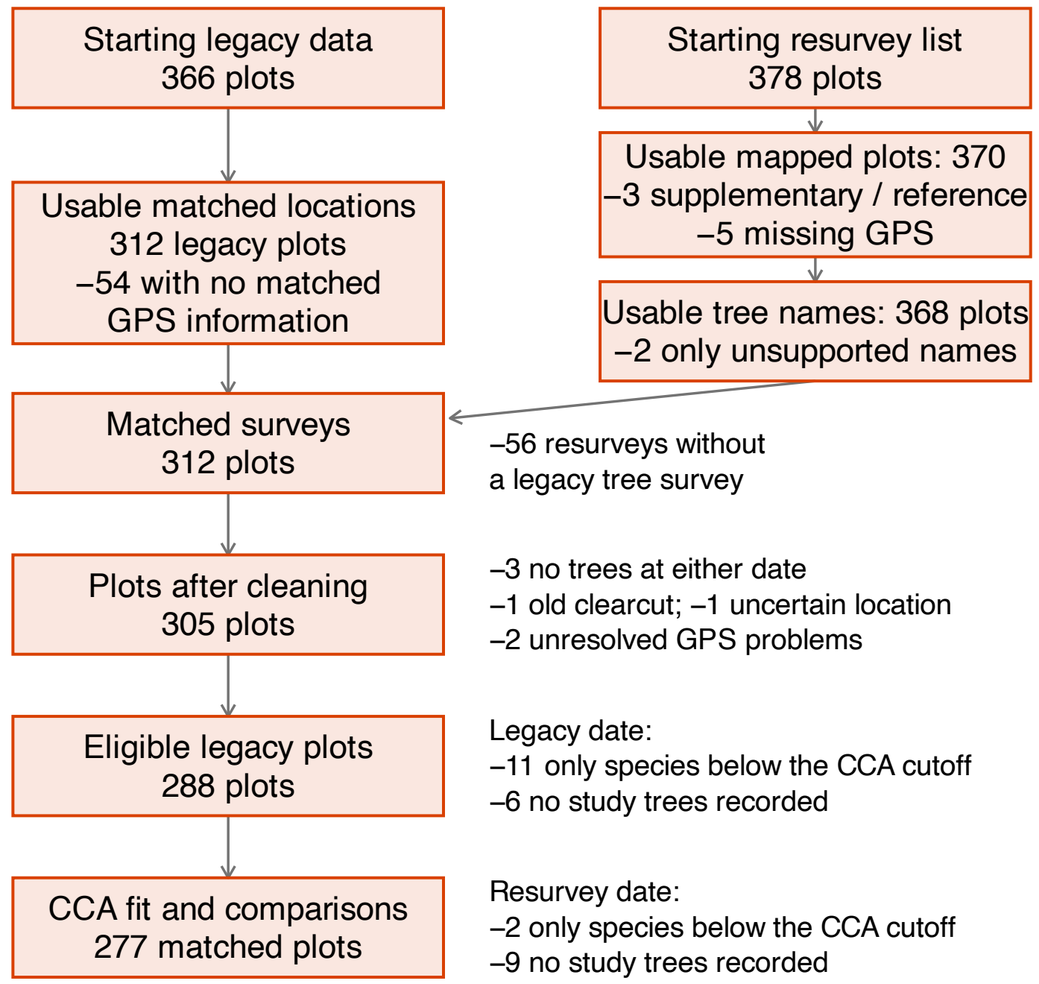
From starting data to the CCA

MORA · modern plots



NOCA · modern plots



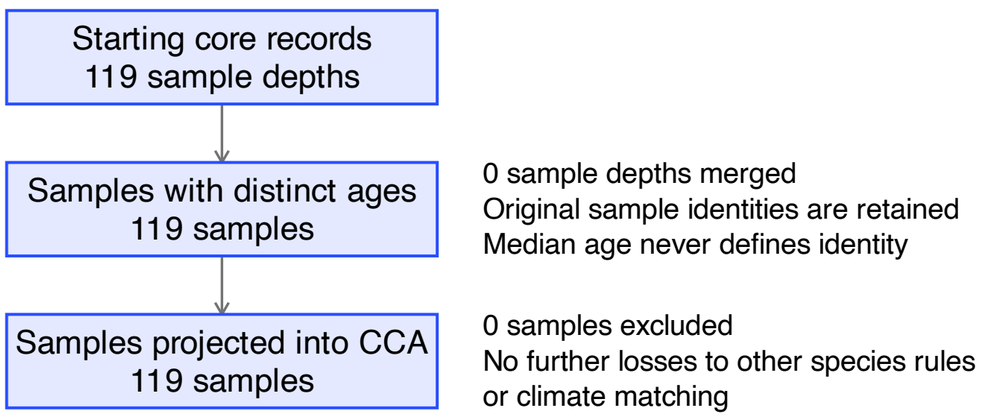
MORA · retained adult-tree plot sizes

Legacy: 289 of 328 plots = 500 m²
39 plots = 250, 375 or 1,000 m²
Resurvey: all 328 plots = 500 m²

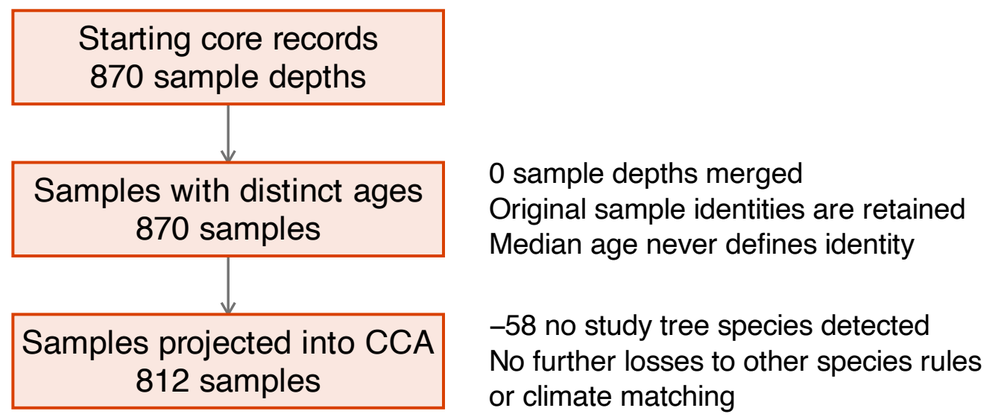
NOCA · retained adult-tree plot sizes

Legacy: 213 of 277 plots = 100 m²
60 plots = 25, 36, 200 or 400 m²
4 legacy plots: area not recorded
Resurvey: all 277 plots = 500 m²

MORA · Holocene samples



NOCA · Holocene samples



The two starting surveys are separate lists; their exclusions must not be added. Legacy and resurvey exclusions are checked before fitting the CCA on matched plots.
CCA keeps a species if it occurs in at least 20 plots or samples in any one site and period. Adult and seedling records supply presence together.
Other preparation choices: 93 MORA seedling record years assigned from adult visits; corrected NOCA tree records applied at 54 plots. All current CCA climate values are complete.
The two MORA plots that burned between the surveys are left out before species selection. Burned NOCA plots stay in the analysis.
