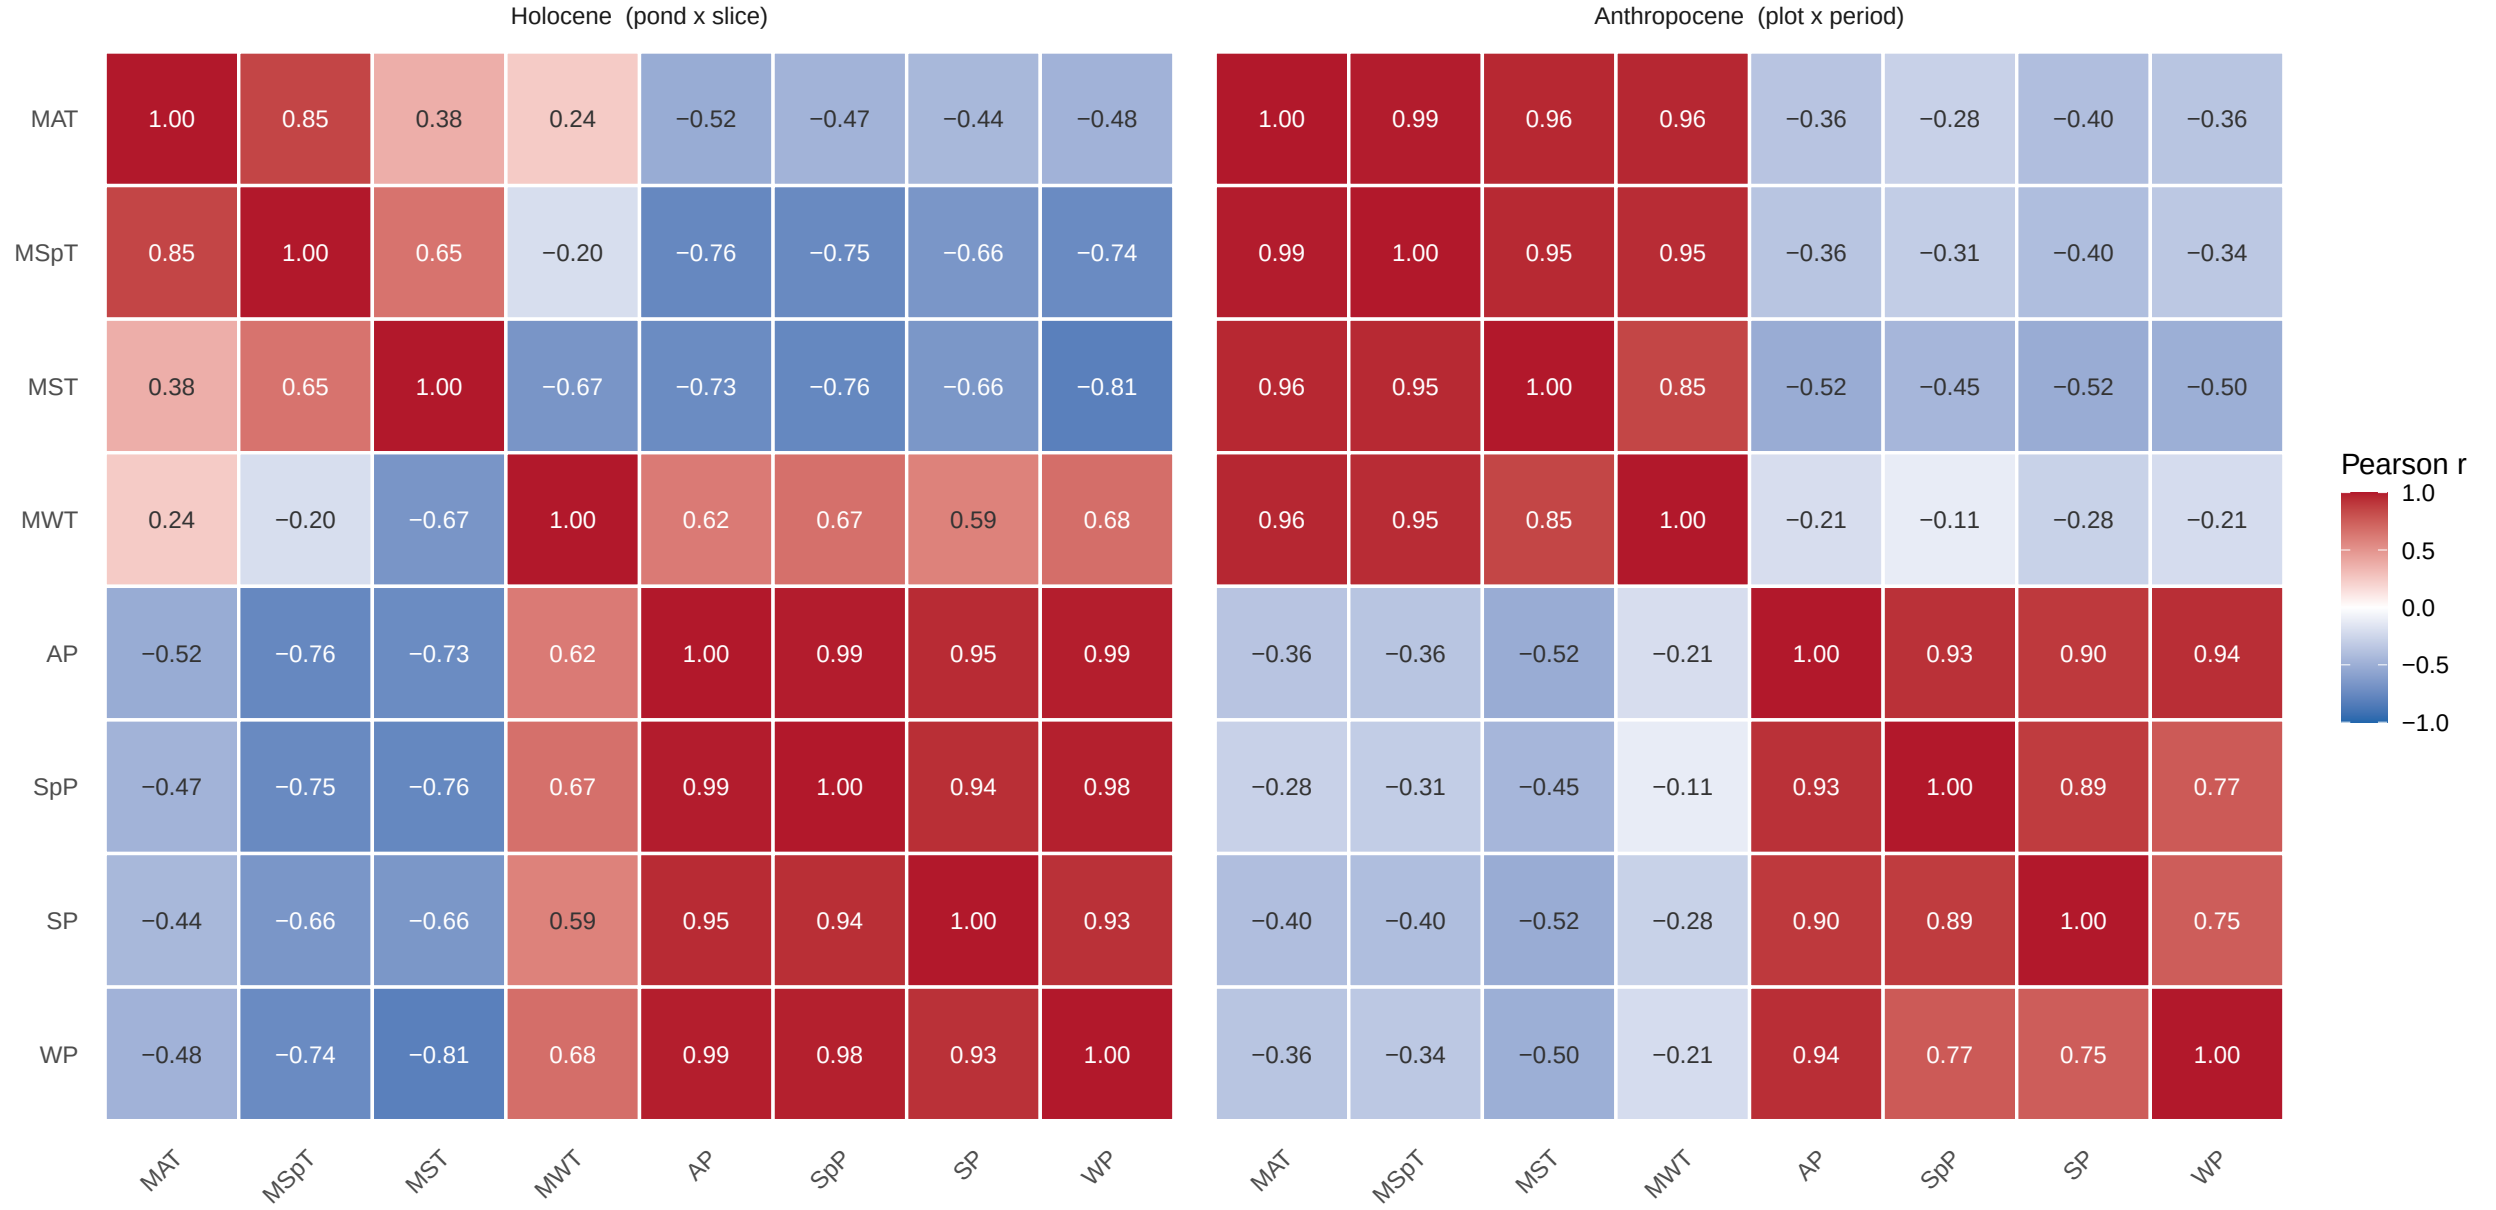
Correlation between climate variables, Holocene vs Anthropocene

The CCA learns the species−climate relationship from the ANTHROPOCENE plots and applies it to HOLOCENE samples.
Contrasting covariance structures can limit transfer; correlations alone do not test predictive validity.



Sign flips with |r| > 0.2 in both eras: MWT~MSpT (−0.20 vs 0.95); MWT~MST (−0.67 vs 0.85); MSpT~MWT (−0.20 vs 0.95); MST~MWT (−0.67 vs 0.85); AP~MWT (0.62 vs −0.21); SP~MWT (0.59 vs −0.28); WP~MWT (0.68 vs −0.21); MWT~AP (0.62 vs −0.21); MWT~SP (0.59 vs −0.28); MWT~WP (0.68 vs −0.21)
