
Descriptive R^2: observed 0.000; pace 0.014; direction 0.004.

Descriptive R^2: observed 0.047; pace 0.031; direction 0.036.

Points: GLS coefficients; bars: conditional 95% confidence intervals. Faded estimates have $p \geq 0.05$.
Fire and climate slopes are shared by MORA and NOCA; the site coefficient is NOCA – MORA.
Holocene: site + climate rate + fire activity, MA(1). Anthropocene: site + burned, independent residuals.
Correction effect = observed final lag – corrected final lag, per century; positive means the correction reduces lag.
$R^2 = 1 - SSE/SST$; descriptive and may be negative for GLS.
