Macrofossil sampling by lake and total fire-event detections

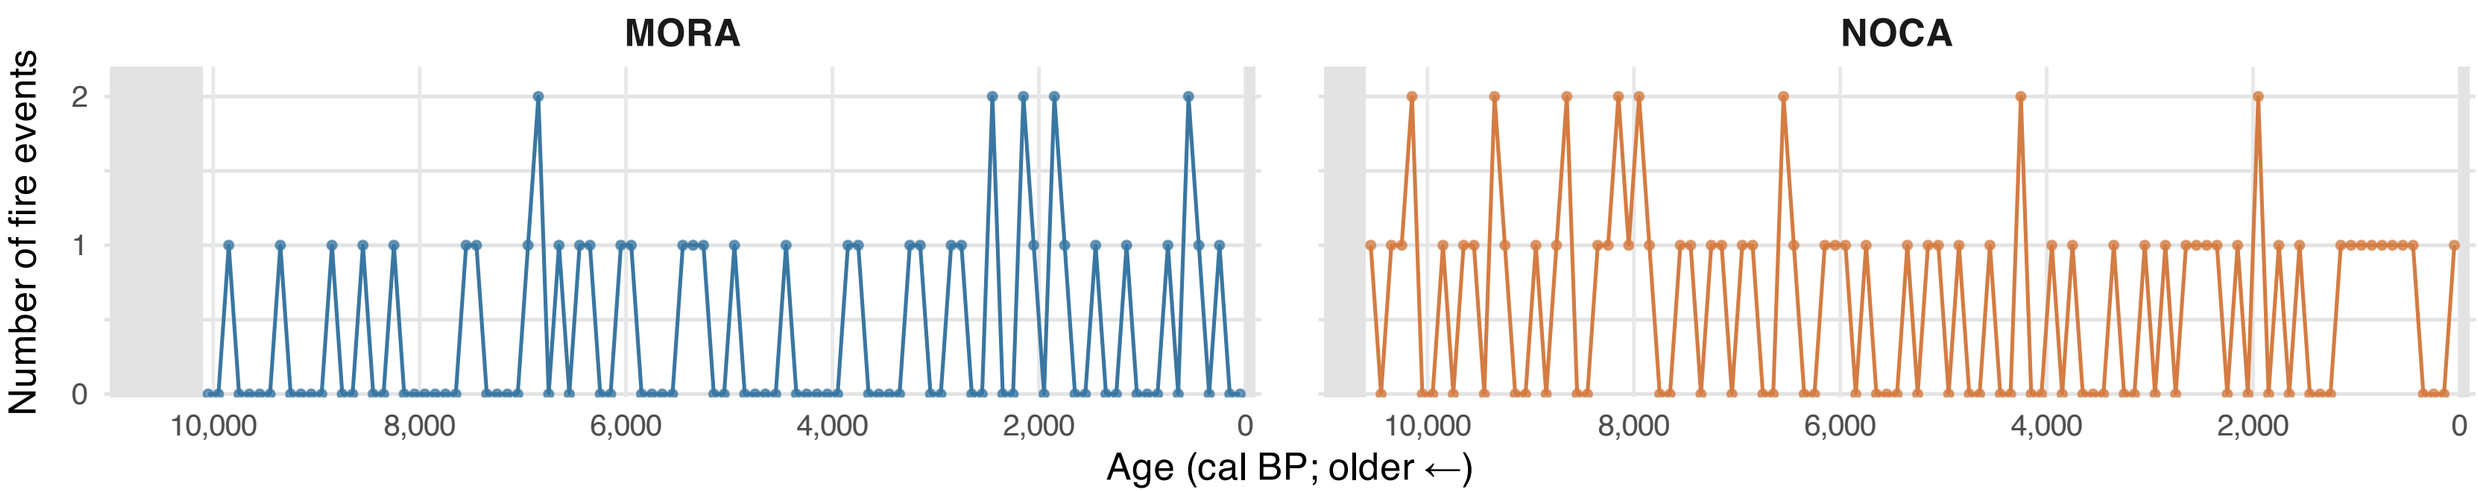

Macrofossil samples per 100-year climate interval

Separate lake trajectories; MORA and NOCA share the same y-axis scale.

Accepted fire events per 100-year climate interval

MORA: summed covered cores; NOCA: Panther Potholes. Grey: insufficient charcoal coverage.

Each prepared sample ID enters once at its unrounded full-posterior median Bacon age: Jay Bath 48; Log Wallow 40; Reflection Pond 31; Panther Potholes 870. Cells are [younger edge, older edge).
Fire totals sum accepted detections from fully covered charcoal cores; MORA requires at least two. These are source detections, not unique regional fires, normalized fire_activity or CHAR.
Counts are not interpolated; median-age placement does not propagate dating uncertainty. Lines do not bridge missing fire coverage.
